

QUALITY ASSURANCE PROJECT PLAN PASSAIC SEDIMENTS RM 10.9 INVESTIGATION

Prepared for:
United States Environmental Protection Agency/Environmental Response Team
Edison, New Jersey

By:
Lockheed Martin/Scientific, Engineering, Response and Analytical Services
Work Assignment Number: SERAS-222

Based on the Intergovernmental Data Quality Task Force Uniform
Federal Policy for Quality Assurance Project Plans
(Final Version 1.1, June 2006)

January 21, 2014

Title: Passaic Sediments RM 10.9 Investigation QAPP
Revision Number: 0.0 d.0
Revision Date: 01/21/14
Page: 1 of 160

QAPP Worksheet #1
Title and Approval Page

Site Name/Project Name: Passaic Sediments RM 10.9 Investigation
Site Location: Passaic River RM 10.9, New Jersey (NJ)

Document Title: Passaic Sediments RM 10.9 Investigation QAPP

Lead Organization: Environmental Protection Agency/Environmental Response Team (EPA/ERT)

Preparer's Name and Organizational Affiliation: Deborah A. Killeen, Lockheed Martin/Scientific, Engineering, Response and Analytical Services (SERAS)

Preparer's Address, Telephone Number, and E-mail Address: 2890 Woodbridge Avenue, Edison, New Jersey 08837, 732-321-4245, deborah.a.killeen@lmco.com

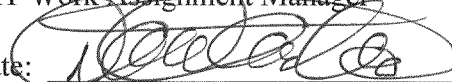

Preparation Date (Day/Month/Year): 01/21/14

Investigative Organization's Project Manager/Date:

Signature

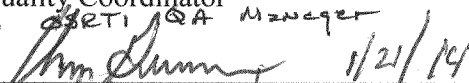

Printed Name/Organization: Marc S. Greenberg/ERT Work Assignment Manager

Investigative Organization's Project QA Officer/Date:

Signature

Printed Name/Organization: Stephen Blaze/ERT Quality Coordinator

Lead Organization's Project Manager/Date:

Signature

Printed Name/Organization: Christopher Gussman/SERAS Task Leader

Approval Signatures/Date:

Signature

Printed Name/Title: Deborah Killeen/SERAS QA/QC Officer

Approval Authority: SERAS

Other Approval Signatures/Date

Signature

Printed Name/Title: Dennis Miller/SERAS Program Manager

Document Control Numbering System: SERAS-222-DQAPPR-012114

Title: Passaic Sediments RM 10.9 Investigation QAPP
Revision Number: 2.0
Revision Date: 01/21/14
Page: 2 of 160

QAPP Worksheet #2
QAPP Identifying Information

Site Name/Project Name: Passaic Sediments RM 10.9 Investigation

Site Location: Passaic River RM 10.9, NJ

Site Number/Code:

Operable Unit:

Contractor Name: Lockheed Martin

Contractor Number: EP-W-09-031

Contract Title: SERAS

Work Assignment Number: SERAS-222

1. Identify regulatory program: Comprehensive Environmental Response and Compensation Liability Act (CERCLA)

2. Identify approval entity: EPA/ERT

3. The QAPP is (select one): ☐Generic ☒Project Specific

4. List dates of scoping sessions that were held: 9/4/2013, 9/6/2013, 9/12/2013, 9/23/2013, 10/21/13

5. List dates and titles of QAPP documents written for previous site work, if applicable:

Title	Approval Date
Uniform Federal Policy-Quality Assurance Project Plan (UFP-QAPP) , SERAS document #SERAS-222-DQAPP-111213	11/18/13
UFP-QAPP – Revision 1, SERAS document #SERAS-222-DQAPPR1-011014	01/14/14

6. List organizational partners (stakeholders) and connection with lead organization:
EPA Region 2

7. List data users:
EPA Region 2

8. If any required QAPP elements and required information are not applicable to the project, then circle the omitted QAPP elements and required information on the attached table. Provide an explanation for their exclusions below:

Comments/Decisions: Givaudan manufactured flavors, fragrances, and specialty chemicals such as pharmaceutical intermediates and pesticides, at a facility in Clifton, NJ from approximately 1913 to 1998. Trichlorophenol was used at the Givaudan facility in the production of hexachlorophene (HCP). Dioxin (2,3,7,8-TCDD) is inherently a contaminant of the trichlorophenol feed stock and resultant production process wastes; 1,2,4,5,7,8-hexachloroxanthene (HCX) has also been associated with the production of HCP. Between 1951 and 1969, the Diamond Alkali Company operated a facility at 80 Lister Avenue, in Newark, New Jersey, manufacturing pesticides. Among other chemicals, the company manufactured 2,4,5-trichlorophenoxy acetic acid, a by-product of which is 2,3,7,8-TCDD. Production activities at the Diamond Alkali facility ceased in August 1969.

SERAS-222-DQAPPR2-012114

FOIA_07123_0001609_0015

Title: Passaic Sediments RM 10.9 Investigation QAPP

Revision Number: 2.0

Revision Date: 01/21/14

Page: 14 of 160

Sediment samples collected in 2011 in the vicinity of RM 10.9 showed elevated concentrations of 2,3,7,8-TCDD and other contaminants at the surface. The age of the surface dates back to 1960. To evaluate Givaudan's potential as a source of dioxin, and to evaluate and compare with the contribution of dioxin from the Diamond Alkali facility, HCP, HCX and 2,4,6,8-tetrachlorodibenzothiophene (TCDT) are compounds of interest in addition to the 12-dioxin-like congeners, 17 dioxins/furans and total polychlorinated biphenyls (PCBs) as Aroclors.

According to the USFWS, HCP, HCX and 2,3,7,8-TCDT are available from Cambridge Isotope (isotope.com) on pages 165, 181 and 206. USGS and USEPA analytical chemists have expertise with some or all of these compounds. For example, the EPA Region I Narragansett lab has expertise with HCX and TCDT.

The areas of focus for sampling are: 1) River at mudflat both core and surface – surface is defined as the top 6 inches (""); 2) Waste cell on Givaudan Property – 3-5' in depth and 3) Waste cell on Diamond Alkali property – 3-5' in depth. EPA would like to oversample side-by-side cores, if possible.

EPA would like us to get out there before the current USEPA removal action that includes dredging and capping is complete. The project decision statement should reflect the presence/absence of analytes and the ratios of the various analytes. Typical QC samples (field duplicates, matrix spikes/matrix spiked duplicates [MS/MSDs], etc.) will be inserted into the sample stream.

Action Items: SERAS will continue working with the labs to determine the feasibility of getting HCP, HCX and 2,4,6,8-TCDT analyzed. EPA will set up conference calls with USGS and then with the Narragansett lab to give us some insight into the extraction and analysis procedures.

Comments/Decisions: 2,4,6,8-TCDT is a compound of interest as it has been identified as an indicator of the production process waste of HCP. 2,3,7,8-Tetrachlorodibenzothiophene is available from Cambridge Isotope. Jan Anderson at the University of Muenster has several dibenzothiophenes that would be helpful to determine where the peaks are. TCDT was analyzed using high resolution gas chromatography/high resolution mass spectrometry (HRGC/HRMS) using a DB-5MS column in the selective ion monitoring (SIM) mode. In the Group 2 window, 95 percent (%) of the tetrachlorothiophenes elute with the penta dioxins/furans. The penta window needs to be stretched to see 2,3,7,8-TCDT otherwise it may be missed. 2,4,6,8-TCDT is one of the early eluters in the window (1/4 to 1/5 of the Group 2 window). An average response factor (RF) of 1 was assigned for the 2,4,6,8-TCDT (Refer to the Tracy et al and the Peterman et al references listed in Worksheet 13)

The standard extraction method for dioxins/furans was used. For the carbon cleanup separation, the lab should collect both fractions to make sure that this compound isn't missed (i.e., retain the eluate that removes the interfering compounds in section 13.5.4 of EPA Method 1613B prior to inverting the column and eluting the TCDDs/TCDFs with toluene)

Revision Number: 2.0

Revision Date: 01/21/14

Page: 16 of 160

There are several papers from the proceedings of the dioxin meetings (dioxin20xx.org) that can be referred to. Extraction and analysis of HCX by Karen Tracy, Battelle, Columbus, Ohio in 2003, go to organohalogen compounds 560, pp177-180. For chromatography of TCDD, see Peterman 2006, Enhanced Chemistry of Dibenzothiophenes, Figure 1 or Figure 2. This links HCX from HCP. Table 1 shows a 50% degradation of HCX in 30 days in nonane only. Table 2 shows the calibration curves. HCX survives the 1613 extraction method (hexa to hepta).

HCP is an inexpensive standard that can be obtained from Sigma. Beller 1988 demonstrated a relatively long half-life for this compound. Allard in 1959 indicated that HCP is quite resistant to change. EPA Method 8270 would work better if it was a derivatization method.

Action Items: SERAS will relay this information to the laboratories that may potentially perform work.

Comments/Decisions: Updates: Ultra Scientific is trying to synthesize 2,4,6,8-TCDD. Cambridge Isotope would synthesize the compound along with a labeled compound in approximately 4 to 6 weeks.

The lab stated that they seem to have better recovery for HCX and TCDD if they modify the EPA Method 1613 extraction. HCX and 2,4,6,8-TCDD would be analyzed together by high resolution mass spectrometry separate from the dioxins. HCP would be analyzed by liquid chromatography/mass spectrometry (LC/MS).

Ray recommended a labeled 2,4,6,8-TCDD due to possible co-elution with 1,2,8,9-TCDD. This would also give a final concentration based on the recovery of the labeled standard.

UPDATE (11/13/13): A labeled and unlabeled source of 2,4,6,8-TCDD will be purchased from Cambridge Isotopes.

Eugenia Naranjo	RPM	EPA R2	212-637-3467	Naranjo.eugenia@epa.gov	Project Oversight

Comments/Decisions: EPA started off the meeting stating that this investigation will be forensic to determine if other potentially responsible parties (PRPs) may have contributed to part of the contamination.

EPA R1 personnel stated that they didn't necessarily look for HCX but found it in the dioxin analysis. 2,4,6,8-TCDD can be found in the same fraction as dioxins. HCX is a by-product that is more dominant in the HCP process than 2,3,7,8-TCDD. EPA R1 stated that the use of Dionex solid phase extraction (SPE) may be better than Soxhlet extraction.

Christopher Gussman	Environmental Scientist (Phytoremediation)/TL	SERAS	732-321-4237	Christopher.d.gussman@lmco.com	Task Leader/Project Oversight & Coordination

Comments/Decisions: Marc stated that we will go ahead with the HCP and the HCX analyses and not the TCDT. Unlabeled and labeled HCP and unlabeled HCX will be used for analysis (what is available). We are looking at 0-2 foot and 2-4 foot intervals for analysis.

Dredging will be completed by October 2, 2013. Stephanie Vaughn (RPM for removal action) will be sending a dredging map. There may be some areas that we will be able to sample.

EPA needs a cost estimate today from SERAS that includes everything (method development, calibration, analysis and method detection limit costs) so he can provide this estimate to the Region.

Action Items: SERAS will supply costs to EPA this afternoon by 3pm (Completed).

UPDATE: Field activities will occur as soon as possible. Two cores will be taken from the dredge zone, 2 cores from cut 5 or 6 (after dredging) and 2 cores from the zone outside of the removal area boundary. Approximately 12 to 15 samples will be collected along with one field duplicate.

UPDATE: Since a source of the labeled and unlabeled 2,4,6,8-TCDT standard is now available, analysis of TCDT will be pursued.

Donna Getty	Statistician	SERAS	732-321-4274	Donna.i.getty@lmco.com	Sampling Design

Comments/Decisions: Capping operations began on 10/28/13. The initial sampling design was scoped as follows: Would like 6 cores in the Passaic River up to 16 samples and one field duplicate. Cesium-137 and beryllium-7 analyses need to be conducted to see recent and historic sediment depositions. Sediment (one core) from each of the areas (no-dredge, downstream of the Removal Area and at the Third River) needs to be dated. Sampling in the river is tentatively due to occur the week of 11/11/13. Six samples will be collected from each of the waste cells located on the Givaudan and Diamond Alkali properties during a subsequent mobilization.

Action Items: SERAS needs to look at the historical data and see where the highest concentrations of contaminants have been found and propose sampling locations and revisions to the initial sampling design.

UPDATE: Field Activities will occur the week of 11/18/13. Add an additional location at the Dundee Dam, upstream of the Third River. There will be a total of 13 locations (4 in the non-dredge zone, 3 in the downstream of Removal Area zone, 2 at the Passaic and Third Rivers confluence, 3 in the Third River and one upstream reference location).

Title: Passaic Sediments RM 10.9 Investigation QAPP
Revision Number: 2.0
Revision Date: 01/21/14
Page: 21 of 160

 Worksheet Not Applicable (State Reason)

QAPP Worksheet #10 Problem Definition

<p>The problem to be addressed by the project: A limited and focused study will be conducted by the Environmental Response Team (ERT) at the request of the EPA Region 2 Emergency and Remedial Response Division (ERRD) to evaluate potential sources of contamination found in the sediment deposit at river mile (RM) 10.9 of the Passaic River including both the former Givaudan facility and the former Diamond Alkali facility. This study will provide data that will be used by EPA Region 2 to inform future site management decisions.</p>
<p>The Lower Passaic River (LPR) is an operable unit of the Diamond Alkali Superfund Site. The LPR 17-mile Remedial Investigation/Feasibility Study (RI/FS) is being conducted by a group of approximately 70 potentially responsible parties (PRPs) called the Cooperating Parties Group (CPG) under an Administrative Order of Consent (AOC) that was signed in May 2007. The RI/FS is scheduled to be complete in 2015. The LPR is tidal and flows from the Dundee Dam at RM 17.4 through densely populated and industrialized areas into Newark Bay. Beginning in the early nineteenth century, the LPR watershed was a major center for industrialized operations including cotton mills, manufactured gas plants, paper manufacturing and chemical manufacturing facilities. These facilities discharged dioxins, petroleum hydrocarbons, PCBs, pesticides and metals to the LPR. Dioxins continue to be a risk driver at the site. CPG has agreed to perform the actions necessary to remove, treat and/or properly dispose of approximately 20,000 cubic yards (yd³) of sediment from the designated RM 10.9 Removal Area and cap this area, to address elevated concentrations of PCDDs/PCDFs, PCBs, metals and PAHs detected in the sediment at RM 10.9.</p>
<p>The former Givaudan facility is situated on approximately 31 acres in a mixed industrial/residential area near RM 10.9 of the western river bank of the LPR in Clifton, NJ. The Passaic River is located approximately 0.3 miles to the southeast of the facility and is tidally influenced.</p>
<p>Givaudan manufactured flavors, fragrances and specialty chemicals and operated at this location from 1913 to 1998. Trichlorophenol was used in the manufacture of HCP. Dioxin is inherently a contaminant of the trichlorophenol feed stock and may be present in resultant production process wastes. HCX has also been associated with the production of HCP. Givaudan ceased operation of the facility in 1998 and currently, the property is occupied by three warehouse buildings in active use that are operated by the Morris Companies.</p>
<p>The environmental questions being asked: Are compounds that may be potentially linked to the Givaudan facility or Diamond Alkali facility present or absent from the sediments at RM 10.9? Are the ratios and/or chemical chromatographic signatures of contaminants found in the river sediments similar to those ratios found in samples collected from the Givaudan and/or Diamond Alkali waste cells? How similar or dissimilar are the contaminant ratios and/or chemical chromatographic signatures between the Givaudan and the Diamond Alkali waste cells?</p>
<p>Observations from any site reconnaissance reports: NA</p>
<p>A synopsis of secondary data or information from site reports: Technical papers regarding analytical methods for the compounds of interest will be used as references for method enhancement. Diagrams, figures, inter-office memos, etc. will aid in the development of the conceptual site model to determine potential contaminant transport pathways to the Passaic River.</p>
<p>The possible classes of contaminants and the affected matrices: PCDDs/PCDFs, pesticides, total PCBs, PCB congeners, HCP, HCX and tetrachlorinated dibenzothiophenes (TCDT) in sediment and waste</p>

SERAS-222-DQAPPR2-012114

Title: Passaic Sediments RM 10.9 Investigation QAPP

Revision Number: 2.0

Revision Date: 01/21/14

Page: 22 of 160

<p>The rationale for inclusion of chemical and nonchemical analyses:</p> <p>PCDDs/PCDFs – Dioxins continue to be a risk driver for the site. These compounds are associated with Givaudan’s and/or Diamond Alkali’s former operations and elevated concentrations in this area were previously documented. Diamond Alkali is also a known source of PCDDs/PCDFs.</p> <p>Total PCB and PCB congeners – Elevated concentrations in this area were previously documented.</p> <p>HCP – This compound was previously produced at the Givaudan facility from trichlorophenol</p> <p>HCX – This compound has been associated with the production of HCP</p> <p>TCDT – The ratio of 2,4,6,8 – tetrachlorodibenzothiophene to 2,3,7,8-tetrachlorodibenzodioxin is expected to be useful for environmental forensics.</p> <p>Cesium-137 and Beryllium-7 – Used for dating the age of the sediments.</p>
<p>Information concerning various environmental indicators:</p> <p>The RM 10.9 Removal Action will include dredging of the sediment to a predetermined depth (uppermost two feet). An engineering cap will be constructed, monitored and maintained. A small portion along the shore at the northeastern most end of the Removal Area cannot be capped due to the grade of the existing slope; thus, this small portion will be dredged to remove contaminated sediment to native material. The Jersey City Municipal Authority has established a no-dredge zone in the vicinity of two potable water supply lines that transect the RM 10.9 Removal Area.</p>
<p>Project decision conditions (“If..., then...” statements):</p> <p>If PCDDs/PCDFs, total PCBs, PCB congeners, HCP and HCX are detected in river sediments, then ERT will evaluate the potential linkage of these contaminants to the sources under investigation (i.e., former Givaudan and Diamond Alkali facilities) in light of the historical data and conceptual site model of the contaminant transport pathways. EPA Region 2 will then use the evaluation to inform future site management decisions.</p> <p>If the ratios or multi-variate analysis of various contaminants of concern indicate a pattern and linkages to the sources under investigation, then EPA Region 2 will use the evaluation to inform future site management decisions.</p>

Revision Number: 2.0

Revision Date: 01/21/14

Page: 23 of 160

 Worksheet Not Applicable (State Reason)

QAPP Worksheet #11
Project Quality Objectives /Systematic Planning Process Statements

Who will use the data? ERT, EPA Region 2, ERRD and the Office of Regional Counsel (ORC)
What will the data be used for? Data will be used to evaluate potential sources of contamination at RM 10.9 and may increase EPA's understanding of the LPR.
What type of data is needed? (target analytes, analytical groups, field screening, on-site analytical or off-site laboratory techniques, sampling techniques) PCDD/PCDFs + TCDT by EPA Method 1613, off-site laboratory PCB Congeners and total PCBs by EPA Method 1668C, off-site laboratory HCX and HCP by laboratory-developed methods, off-site laboratory Cesium-137 (Cs-137) and Beryllium-7 (Be-7) by gamma spectrometry, off-site laboratory GPS data of each sample location, field data
How "good" do the data need to be in order to support the environmental decision? PCDD/PCDF, PCB congener, total PCBs, HCX, HCP, TCDT, Cs-137 and Be-7 will be considered Definitive Data. GPS data will be considered supporting meta data and Screening Data (verified but not validated).
How much data are needed? (number of samples for each analytical group, matrix, and concentration) From the River: PCDD/PCDFs, PCB Congeners, HCX, HCP, TCDT – 19 sediment samples, Cs-137 and Be-7 – 50 sediment samples and GPS – 13 sediment locations. From the Waste Cells: PCDD/PCDFs, PCB Congeners, HCX, HCP, TCDT – 12 samples
Where, when, and how should the data be collected/generated? Sediment samples will be collected the week of November 18, 2013 using vibracore techniques. The river has been broken down into three areas of interest: the "no-dredge" zone within a portion of the Removal Area; the area below the designated Removal Area; and the confluence of the Passaic and Third Rivers and within the Third River. Sediment samples will be collected from the locations identified on Figure 1, Proposed Sampling Map. An additional sample will be collected near the area known as the Dundee Dam, upstream of the confluence of the Third and Passaic Rivers as a reference. Specific information on depths and analyses can be found on Worksheet #14. At a later date (to be determined), approximately 6 samples will be collected from each of the waste cells located on the Givaudan and Diamond Alkali properties. The QAPP will be amended to reflect this work.
Who will collect and generate the data? A vibracore contractor will be procured to advance sediment core samples to approximate depths below the sediment surface depending on design targets (see Worksheets 14, 17 and 18) and collect GPS data on those cores. Sediment cores will be recovered and transferred to SERAS personnel for processing after they are collected, cut and capped. GPS data on locations where vibracoring is not an option (i.e., depositional sediment surface sampling in the Third River) will be recorded by SERAS field personnel. Sediment samples after processing will be submitted to Vista Analytical and Outreach laboratories for analysis.

Title: Passaic Sediments RM 10.9 Investigation QAPP

Revision Number: 2.0

Revision Date: 01/21/14

Page: 24 of 160

How will the data be reported?

Validated data for the sediment samples will be reported in a Final Analytical Report (AR) that will be prepared in accordance with SERAS SOP #4020, *Analytical Report Preparation*. A Trip Report (TR) will be prepared and delivered to the EPA/ERT WAM in accordance with SERAS SOP #4017, *Preparation of Trip Reports* after the field mobilization. A draft summary report will be prepared that will include a weight of evidence discussion with accompanying tables and spreadsheets that summarize the data. This report will be prepared in accordance with SERAS SOP #4019, *Preparation of Preliminary Reports*. Data will be disseminated to EPA Region 2 by the WAM.

How will the data be archived?

Hardcopies of all deliverables will be stored in SERAS Central Files and e-copies will be stored on SERAS Local Area Network (LAN). Data will be imported into a Scribe database and posted to the ERT IMS website. Data will be archived by SERAS in accordance with Administrative Procedure (AP) #34, *Archiving Data Electronic Files*. Analytical data from the outside laboratory will be archived by the SERAS QA/QC Group both in hard copy and electronically.

QAPP Worksheet #14 Summary of Project Tasks

Sampling Tasks:

Sediment core samples will generally be obtained from surface to depths of 4 to 8 feet below the sediment surface using vibracore techniques (maybe more than one core at some locations). Sediment core samples will be collected in four-inch diameter chemically clean rigid sleeves. During core recovery, the subcontractor must minimize sediment loss from the bottom of the core. When the cores are recovered, they will be capped on both ends and kept vertical to minimize disturbance of surficial layers until overlying water can be siphoned off. Locations will be recorded using GPS by the vibracoring subcontractor. The top of the core above the sediment surface will be removed and capped so that the core can be efficiently transported with minimal disturbance. The subcontractor along with SERAS personnel will inspect each core to ensure an intact and representative sample. Intact cores will then be transferred to LM personnel for processing. Samples will be collected in accordance with SERAS SOP #2016, *Sediment Sampling*.

The investigation area has been broken down into three areas of interest: the “no-dredge” zone within a portion of the Removal Area; the area below the designated Removal Area; and the confluence of the Passaic and Third Rivers and within the Third River.

“No-Dredge” Zone - Four cores will be advanced in the “no-dredge” zone to approximately 5 feet. Two samples will be collected from the 0-0.5’ and 1-3’ intervals and two samples from the 0-0.5’ and 3-5’ intervals for a total of 8 samples for PCDDs/PCDFs, 209 PCB congeners, total PCBs, HCB, HCP and TCDD. One additional core will be advanced at one of these locations to 5 feet and sampled at each 0.5’ interval for Cs-137 and Be-7 for a total of 10 samples.

River Confluence - Two cores will be advanced at the confluence of the rivers to the bottom of the sediment bed. Samples will be collected from the 0-0.5’ interval and one foot from the bottom of the sediment. Three additional sediment samples within the Third River on the other side of the Route 21 bridge will be collected at surface only (0-0.5’) for a total of 7 samples for PCDDs/PCDFs, 209 PCB congeners, total PCBs, HCB, HCP and TCDD. One additional core will be advanced at one of the two locations at the confluence of the rivers and sampled at each 0.5’ interval for Cs-137 and Be-7 for a total of 8-16 samples (depending on the depth).

Downstream of the Removal Area – Three cores will be advanced in this zone to approximately 8 feet. Sediment samples will be collected from the 6-8’ interval for PCDDs/PCDFs, 209 PCB congeners, total PCBs, HCB, HCP and TCDD for a total of 3 samples. One additional core will be advanced in this area up to 8 feet with samples collected every 0.5 foot intervals for Cs-137 and Be-7 for a total of 16 samples.

Upstream Reference Location – One sediment sample will be collected from a location above Dundee Dam. It is anticipated that samples will be collected from the 0-0.5’ and 1-2’ intervals. One additional core will be advanced in this area up to 8 feet with samples collected every 0.5 foot intervals for Cs-137 and Be-7 for a total of 16 samples.

NOTE: Sampling depths are based upon previous information and may not be attainable at some locations.

All non-dedicated sampling equipment will be decontaminated between each sample location as follows:

1. Physical removal of sediment/debris using potable water and a scrub brush or high pressure washer.
2. Non-phosphate detergent wash (liquinox)
3. Water rinse
4. Air dry

At a later date, up to six samples will be collected from each of the waste cells located on the Givaudan and Diamond Alkali properties.

SERAS-222-DQAPPR2-012114

FOIA_07123_0001609_0039

Title: Passaic Sediments RM 10.9 Investigation QAPP

Revision Number: 2.0

Revision Date: 01/21/14

Page: 38 of 160

Analysis Tasks:

Dioxins/Furans & TCDT by EPA Method 1613B

PCB Congeners and total PCBs by EPA Method 1668C

HCB – Vista SOP #41, Revision 2 (Gas Chromatography with high-resolution mass spectrometry [GC/HRMS])

HCP – Vista SOP #50, Revision 2 (Liquid Chromatography with quadrapole mass spectrometry [LC/MS/MS])

Cs-137 and Be-7 – Outreach SOP #RAD_04-11 (Gamma Spectroscopy)

Quality Control Tasks: Refer to Worksheet #20 for field QC Samples and Worksheets #12 and #28 for analytical QC Samples based on subcontract laboratory SOPs.

Secondary Data: Historical dioxin and PCB data will be mapped to determine the core locations and sample depths. Refer to Figure 1.

Data Management Tasks: Field data will be recorded in field notebooks. Laboratory data will be recorded in laboratory notebooks. SCRIBE will be used for data management. A Trip Report and a Technical Memorandum (Summary Report) will be posted to the ERT/Information Management System (IMS) website for this WA. Posting of the reports will be considered as completion of the deliverable. Hard copies of the deliverables will be archived in the SERAS Central Files. Electronic formats for the deliverables will be saved on the SERAS archive drive and archived in accordance with AP #34, *Archiving Electronic Files*.

Documentation and Records: Observations noted during field efforts will be documented in accordance with SERAS SOP #4001, *Logbook Documentation* and SERAS SOP #2002, *Sample Documentation*. Documents and records that will be generated during this project include: Work Plan (WP), QAPP, Health and safety plan (HASP), Field Documentation, Laboratory Logbooks, Sample Labels, Chain of Custody Records, Custody Seals, Analytical Report, Data Review Records, Data Reduction Records and Field Change Forms, if necessary. The trip report will include site background, observations and activities, and conclusions, results and/or recommendations. The trip report will be prepared in accordance with SERAS SOP #4017, *Preparation of Trip Reports*. The technical memorandum (summary report) will include brief text and risk summary tables.

Assessment/Audit Tasks: A performance audit of field operations is not anticipated for this project. The tasks associated with the QAPP are assessed using peer and management system reviews. Peer review enables the task leader to identify and correct reporting errors before reports are submitted. Management system reviews establish compliance with prevailing management structure, policies and procedures, and ensures that the required data are obtained.

Data Review Tasks: Analytical data for dioxins/furans, PCB congeners and total PCBs, HCB, HCP and TCDT will be validated in accordance with the SOPs listed in Worksheet #36. All SERAS project deliverables will receive an internal peer review prior to release as per the guidelines established in SERAS Administrative Procedure (AP) #22, *Peer Review of SERAS Deliverables*.

QAPP Worksheet #15-1
Reference Limits and Evaluation Table

Matrix: Sediment

Analytical Group: Dioxins/Furans

Concentration Level: Low

Analyte	CAS Number	Project Action Limit (ng/kg)	Project Quantitation Limit (ng/kg)	Analytical Method EPA Method 1613B		Achievable Laboratory Limits	
				MDLs	Method QLs ¹ (ng/kg)	MDLs (ng/kg) ²	QLs ³ (ng/kg)
Total HpCDF	NA	NS	1.0	NA	NA	NA	1.0

¹Based on 10 grams (g) of sample and final volume of 20 microliters (μL)

²Based on LOD/LOQ Study from Vista Analytical dated 8/13/2013

³Final QL will be adjusted based on the total solids content for each sample.

NS = not specified, NA = not applicable

ng/kg = nanograms per kilogram

Matrix:	Sediment					
Analytical Group:	Radionuclides					
Concentration Level:	Low					
Analyte	CAS Number	Project Action Limit (pCi/g)	Project Quantitation Limit (pCi/g)	Analytical Method		Achievable Laboratory Limits ³
				MDLs	Method QLs (pCi/g)	QLs (pCi/g)
Beryllium-7	13966-02-4	NA ¹	0.3	NA	NA	0.3
Cesium-137	10045-97-3	NA ¹	0.10	NA	NA	0.10

NS = not specified

NA = not applicable

- There are no action levels established for these parameters for this Study.
- The target QLs are set at a low level intended to allow for dating of the sediment.
- Lab results will be in dry weight. Actual QLs may be higher and are dependent on the amount of sample available and counting time.

pCi/g = picocuries per gram

QAPP Worksheet #17 Sampling Design and Rationale

Describe and provide a rationale for choosing the sampling approach (e.g., grid system, biased statistical approach):

The overall objective of this study is to evaluate if potential sources of contamination found in the sediment deposits at RM 10.9 of the Passaic River may be potentially linked to the former Givaudan or Diamond Alkali facilities. Resource limitations (costly analytical method development and analysis) have led to the development of a focused study design and sample size of 30 for analysis of the contaminants of concern across all targeted locations. These locations include the sediments at Passaic River RM 10.9 and the Third River, and the waste cells present on the former Givaudan and Diamond Alkali facilities. This sampling and analysis plan pertains to the sampling of sediments.

Sediment sampling will be conducted at the following locations:

- "No-dredge zone" portion of the Removal Area,
- Downstream of the designated Removal Area,
- In the region of the confluence of the Third River with the Passaic River
- In the Third River above the Rte. 21 bridge
- Upstream of the Third and Passaic Rivers confluence near Dundee Dam

These sampling results will be compared to samples which will be collected from the former Givaudan and Diamond Alkali facilities waste cells (note: sampling at the former facilities will be provided in a revision to this document).

The weight of evidence approach which will be used to evaluate the former Givaudan and Diamond Alkali facilities as potential sources of sediment contamination within this stretch of the Passaic will include the computation of contaminant ratios which will act as a method of fingerprinting the waste streams produced by the historical chemical processes of Givaudan and Diamond Alkali. These fingerprints will be compared to the contaminant ratios found within the no dredge zone, below the Removal Area, within the Third River and its confluence with the Passaic River and upstream near the Dundee Dam. The evaluation of chromatographic results (e.g., peak patterns, chemical signatures, etc.) will also be used as a line of evidence.

No-Dredge Zone. Sampling within the Removal Area will occur within the no-dredge zone of the RM 10.9 Removal Area. Dredging activities in the Removal Area were completed on October 4, 2013 and capping is expected to commence during the week of November 4, 2013. The no-dredge zone overlays a known underground water pipe. Historical data from within the no dredge zone is limited to 4 sediment core locations from which samples were collected in 2011. TCDD concentrations were highest at the surface of the sediments, decreasing with depth, and with a significant drop-off below 3.5 feet. PCBs at these 4 locations were also consistently within detectable ranges at surface and down to 2.5 feet. These results indicate that focusing on the top 2 feet of sediments is expected to be useful for the present investigation.

Sediment sampling and analysis for the COCs will be conducted at the surface (0 to 6 inches) for all four proposed sediment locations. Two sediment cores will be sampled from the 1-3' interval and two samples will be sampled from 3-5' interval. Historical data has indicated that both TCDD and PCBs are within detectable ranges at these depth intervals. These samples will be collected from four cores (total of 8 samples) located within the center of the no-dredge zone. Visual Sample Plan was used to generate 4 random coordinates within this area. Randomness was included in the sample design to support future comparisons with the Givaudan and Diamond Alkali waste cell results. Coordinates of the cores are below:

Title: Passaic Sediments RM 10.9 Investigation QAPP

Revision Number: 2.0

Revision Date: 01/21/14

Page: 56 of 160

X-Coordinate:	Y-Coordinate:
572930.3495	4518941.0445
572917.6358	4518907.5235
572909.6868	4518916.4624
572928.7603	4518923.1666

A core will also be advanced to approximately 4 feet with samples collected every ½ foot, for a total of 8 samples, which will be sent for Cs-137 and Be-7 dating. The sampling depths of the COCs will be linked to a frame of time when the corresponding sediment was deposited in the river.

Downstream of the Removal Area. Examination of the TCDD and PCB analytical results for historical sampling which occurred in the “fingertip” portion (below the removal area) of the sediment deposit area identified high levels of TCDD at depths between 5 ½ to 7 ½ feet with TCDD concentrations as high as 40,800 picograms per gram (pg/g). These samples were collected in 2011. To further investigate these deposits, the present study will collect 3 cores south of the removal area with sample collection occurring from the interval of 6 to 8 feet. Coordinates of the proposed core locations are:

X-Coordinate:	Y-Coordinate:
572753.6416	4518629.4755
572779.7475	4518757.6318
572764.7168	4518698.3002

A core will also be advanced within this area to approximately 8 feet with samples collected every ½ foot, for a total of 16 samples, which will be sent for Cs-137 and Be-7 dating.

Third River. The Third River will be evaluated as a potential transport pathway of waste from the Givaudan facility; however, there are limited historical data regarding COC concentrations within the sediment in the Third River and at its confluence with the Passaic.

It is recommended that 2 cores be advanced into the sediments at the confluence of the Rivers. At this time, no information is available regarding the depth of the sediment within this area. Suggested sampling intervals are surface (0-6 inches) and 1 foot above the bottom of the sediment (to be determined in the field by probing), which will result in another 4 samples for analysis of COCs. An additional core will be advanced in this area, with samples collected every ½’ until the bottom of the sediment is reached. These samples will be sent for Cs-137 and Be-7 dating.

It is recommended that three surface sediment samples be collected within the Third River above the Rte. 21 Bridge. Location of these samples will be dependent on the river flow and the actual presence of sediment. In this region, much of the Third River has a rocky, graveled bottom with little sediment.

Upstream Reference Location. One sediment sample will be collected from a location above Dundee Dam, upstream of the confluence of the Third and Passaic Rivers. It is anticipated that samples will be collected from the 0-0.5’ and 1-2’ intervals. An additional core will be advanced in this area, with samples collected every ½’ to 4’. These samples will be sent for Cs-137 and Be-7 dating.

Describe the sampling design and rationale in terms of what matrices will be sampled, what analytical groups will be analyzed and at what concentration levels, the sampling locations (including QC, critical, and background samples), the number of samples to be taken, and the sampling frequency (including seasonal considerations) [May refer to map or Worksheet #18 for details]:

Refer to Worksheets 11, 14 and 18

**QAPP Worksheet #24-1
Analytical Instrument Calibration Table**

Instrument	Calibration Procedure	Frequency of Calibration	Acceptance Criteria	Corrective Action (CA)	Person Responsible for CA	SOP Reference ¹
HRGC/HRMS (dioxins/furans and TCDD)	Tune using PFK	Prior to sample analysis	Resolving power $\geq 10,000$ at $m/z = 304.9824$ or any other reference signal close to $m/z 304$ (from TCDF). Deviation between the exact m/z and theoretical m/z must be < 5 ppm	Retune instrument Reanalyze PFK	Vista Analytical Chemist	EPA 1613B (with TCDD added)
	Column Performance Check Solution (CPCM). Solution includes the Window Defining Mix	Prior to 12 hours of sample analysis	Used to set retention times of first and last eluters. CPCM must have $\leq 25\%$ valley resolution for 2,3,7,8-TCDD and 2,3,7,8-TCDF	Readjust windows. Evaluate system. Perform maintenance. Reanalyze CPCM.		
	6-Point Initial Calibration (ICAL)	Initially and as required	Ion ratios within Table 9 limits*, and $S/N \geq 10:1$. Absolute retention time of $^{13}C_{12}-1234-TCDD > 25$ min on DB-5 column and retention time of $^{13}C_{12}-1234-TCDD > 15$ minutes on DB-225 column	Evaluate system. Recalibrate. If all criteria are met except the ion ratios, evaluate impact and document		
	Daily Continuing Calibration Verification (CCAL)	Once per 12 hours, prior to sample analysis	Analyte concentrations must be within the limits specified in Table 6 of method 1613B.	Evaluate system. Evaluate data for usability. Reanalyze CCAL. Recalibrate (ICAL).		

¹Specify the appropriate reference letter or number from the Analytical SOP References table (Worksheet #23)

*Due to differences monitored for PeCDD, the ion ratio will differ from the limits in EPA Method Table 9. The M+2 and M+4 are monitored because there is less interference from PCBs.

Sample Handling System**

SAMPLE COLLECTION, PACKAGING, AND SHIPMENT
Sample Collection (Personnel/Organization): Christopher Gussman/SERAS
Sample Packaging (Personnel/Organization): Christopher Gussman/SERAS
Coordination of Shipment (Personnel/Organization): Christopher Gussman/SERAS
Type of Shipment/Carrier: Fed-Ex to Vista Analytical and Outreach Laboratory
SAMPLE RECEIPT AND ANALYSIS
Sample Receipt (Personnel/Organization): Sample Custodian, Vista Analytical and Outreach Laboratory
Sample Custody and Storage (Personnel/Organization): SERAS TL, Christopher Gussman and Sample Custodian, Vista Analytical and Outreach Laboratory
Sample Preparation (Personnel/Organization): Laboratory Chemists, Vista Analytical and Outreach Laboratory
Sample Determinative Analysis (Personnel/Organization): Laboratory Chemists, Vista Analytical and Outreach Laboratory
SAMPLE ARCHIVING
Field Sample Storage (No. of days from sample collection): Ship within 1 to 3 days to the respective laboratories.
Sample Extract/Digestate Storage (No. of days from extraction/digestion): All samples are to be extracted and analyzed within holding times mandated by each analytical method.
Biological Sample Storage (No. of days from sample collection): NA
SAMPLE DISPOSAL
Personnel/Organization: Sample Custodian, Vista Analytical and Outreach Laboratory
Number of Days from Analysis: As per subcontract laboratories defined procedures to retain samples once results have been reported.

 Worksheet Not Applicable (State Reason)

QAPP Worksheet #27 Sample Custody Requirements

Field Sample Custody Procedures (sample collection, packaging, shipment, and delivery to laboratory):
Each sample container will be affixed with a label identifying the sample number, sample location, collection date, collection time, matrix, requested analysis, and preservative. Each sample container will be placed in a re-sealable clear plastic bag and stored in a cooler on wet ice after collection. Sample coolers/containers will be forwarded to the assigned laboratories under specific chain-of-custody (COC) forms, and shipped via overnight courier to laboratory personnel. Sample coolers will contain ample packing material and wet ice, and will be sealed with duct tape or strapping tape. Custody seals will be placed over openings to ensure cooler and sample integrity. At least two custody seals will be placed across the shipping containers to ensure sample integrity.

EPA/ERT Scribe software will be used for sample management, as well as, generation of sample documentation, such as, labels and COC records. All COC records will be peer reviewed prior to shipment of samples in accordance with SERAS SOP #4005, *Chain of Custody Procedures*. Samples will be shipped within 24-72 hours of sampling for next-day delivery under COC to the appropriate laboratory in accordance with SERAS SOP #2004, *Sample Packaging and Shipment*. Procedures outlined in SOP #2002, #2003, and #2004 will be applied (refer to Worksheet #21).

Laboratory Sample Custody Procedures (receipt of samples, archiving, disposal):

A sample custodian at the subcontract laboratories will accept custody of the shipped samples. As applicable, the custodian will record the cooler temperature, and inspect the samples for discrepancies, proper non-chemical preservation and container integrity before forwarding the samples to the appropriate department for analysis. The laboratory manager will be notified of any problems. Samples may be archived at Vista Analytical until it is known whether a TCDT standard can be synthesized by an outside vendor. Disposal will be in accordance with the outside laboratory's disposal protocols.

Sample Identification Procedures:

Each sample will be identified with a unique identification number at the time of collection as follows. An abbreviated letter designation consisting of two or three letters as identified on Worksheet #18 (e.g., ND = No Dredge Zone) followed by a three digit numerical sample number at each area (e.g., 001) and the depth will be assigned to each sample collected. For example, the second core collected at surface from the No-Dredge zone would be labeled as ND-002-0-0.5. A unique laboratory number will be assigned to each sample during receipt at the respective laboratories. The number will be listed on the label of every sample container collected at a given location. Procedures outlined in SOP #2002 will be applied (refer to Worksheet #21).

Chain-of-custody Procedures:

Chain-of-custody records will be generated for all samples submitted for analysis using Scribe database software. Procedures outlined in SOP #4005 will be applied (refer to Worksheet #21).

Page: 100 of 160

 Worksheet Not Applicable (State Reason)

QAPP Worksheet #37 Usability Assessment

Summarize the usability assessment process and all procedures, including interim steps and any statistics, equations, and computer algorithms that will be used: See below.
Describe the evaluative procedures used to assess overall measurement error associated with the project: See below.
Identify the personnel responsible for performing the usability assessment: Assessment of data usability will be done by EPA Region 2 personnel, ERT WAM and SERAS Statistician.
Describe the documentation that will be generated during usability assessment and how usability assessment results will be presented so that they identify trends, relationships (correlations), and anomalies: Ratios of 2,4,6,8-TCDD to 2,3,7,8-TCDD or other ratios if analytes are expected to be useful for environmental forensics.

The following items will be assessed and conclusions drawn based on their results:

Holding Time: All sample data will be checked to verify that both sample preparation and analysis were performed within the method required holding time.

Calibration: Data associated with instrument calibration and verification of calibration will be reviewed to confirm that all data were generated using properly calibrated instrumentation.

Accuracy/Bias Contamination: Results for all laboratory method blanks and instrument calibration blanks will be checked against performance criteria specified in Worksheet # 28; results for analytes that exceed criteria will be identified and the impact on field sample data will be assessed. Data will be summarized by type of blank.

Accuracy/Bias Overall: Reported values of laboratory control samples, performance samples, and matrix spikes will be evaluated against the spiked or certified concentration and the percent recovery will be calculated and compared to the criteria specified in Worksheet #28. The percent recovery information will be used to assess the bias associated with the analysis. Recovery for matrix spikes in conjunction with the recovery reported for performance samples and laboratory control samples will provide information on the impact of the sample matrix on specific analyses. Average recoveries will be calculated and reported by analyte for each type of QC sample.

Precision: Results of the relative percent difference (RPD) will be calculated for each analyte in laboratory. These RPDs will be checked against measurement performance criteria presented on Worksheet #28; RPDs exceeding the stated criteria will be identified.

Sensitivity: Reporting limits will be checked against the criteria presented on Worksheet #15 and QLs presented on Worksheet #15.

Representativeness: A review of field records will be used to confirm that sample collection and handling was performed in a manner that conformed to the designated SOP. Similarly laboratory preparation procedures will be reviewed during validation to ensure that a representative sample was selected for analysis. Any deviations or modifications to field or laboratory procedures which might impact the representativeness of the sample will be discussed in the project final report.

Comparability: The sampling and analytical procedures which will be used in this program have been selected to ensure that the resulting data will be comparable to data from similar programs conducted previously or which will be conducted in the future. Any modifications or deviations from stated procedures which might impact data comparability will be addressed in the project final report.

Completeness: Completeness for the analytical program will be calculated as the number of data points that are accepted as usable based on the validation process divided by the total number of data points for each analysis.

SOP 41	Revision: 2	Supersedes: Rev1
EXTRACTION AND ANALYSIS OF HEXACHLOROXANTHENE BY HRMS		
Analyst Review: <i>[Signature]</i>		
Management: <i>[Signature]</i>		
Quality Assurance: <i>[Signature]</i>		
Effective Date: 1 November 2013		

Revision	Description of Revision
1	Added Section 6.12: Separatory Funnel. Removed Section 6.17: Whatman filters. Added Section 7.1.5: Carboxpack B/Celite. Added Section 9.3: Residual chlorine detection. Added Sections 410.1 and 10.2, renumbered. Added Section 10.5. Added Section 11.1: Aqueous extraction, 11.2: soil extraction. Sections 12.2 and 12.3 no longer optional.
2	Replaced MeCl ₂ with DCM. Replaced soxhlet with soxhlet/Dean-Stark (SDS). Section 7.2.6 Added Ethyl Acetate. Section 8.3.3: Revised MS/MSD acceptance criteria. Section 8.4.3: Revised duplicate samples acceptance criteria. Section 11.2: Added 70:30 Hexane: Ethyl Acetate. Section: 11.2.3 Replaced DCM with 70:30 Hexane: Ethyl Acetate.

1. PURPOSE

- 1.1. This procedure describes the preparation and analytical techniques used for the analysis of soil/sediment and aqueous samples for the determination of Hexachloroxanthene (HCX) by HRMS.

2. SUMMARY OF METHOD

- 2.1. This procedure uses matrix specific extraction, analyte specific cleanup, and HRGC/HRMS analysis techniques.
- 2.2. This method covers the determination of Hexachloroxanthene (HCX). The following parameter may be determined by this method:

Parameter	CAS No.
1,2,4,5,7,8-Hexachloroxanthene.	38178-99-3

- 2.3. Detection limits are sample-specific.

3. INTERFERENCES

- 3.1. Solvents, reagents, glassware and other sample processing hardware may yield discrete artifacts or elevated baselines that may cause misinterpretation of the chromatographic data. All of these materials must be demonstrated to be free from interferants under the conditions of analysis by performing laboratory method blanks. Analysts should avoid using PVC gloves.
- 3.2. The use of high purity reagents and solvents helps minimize interference problems.
- 3.3. Interferants co-extracted from the sample will vary considerably from matrix to matrix.
- 3.4. If interferences are encountered, the method provides selected cleanup procedures to aid the analyst in their elimination.

4. DEFINITIONS

- 4.1. Definitions are presented in the Glossary.

5. SAFETY

- 5.1. Procedures shall be carried out in a manner that protects the health and safety of all Vista employees, including the appropriate use of Personal Protective Equipment and engineering controls.

- 5.2. Each chemical compound should be treated as a potential health hazard. Exposure to these compounds should be reduced to the lowest possible level. Only highly trained personnel thoroughly familiar with handling and cautionary procedures and the associated risks should handle all compounds or reagents.
- 5.3. Each chemical compound should be handled in well-ventilated, controlled access laboratories.
- 5.4. Additional health and safety information can be obtained from material safety data sheets (MSDSs) available to all personnel involved in these analyses.
- 5.5. In the event of a known or potential compromise to the health and safety of a Vista associate, all work must stop and the incident reported immediately to management.

6. APPARATUS AND MATERIALS

- 6.1. Analytical Balances, capable of reading to 0.01g and 0.0001 g
- 6.2. Crimp top autoinjector vials plus caps and crimp tool
- 6.3. Drying Oven, VWR Model 1320 or equivalent
- 6.4. Electrothermal electromantle six sample and 500 & 1000 mL capacity
- 6.5. Funnels, 100 mm
- 6.6. Glass columns, 160 mm x 11 mm and 200 mm x 15 mm
- 6.7. Glass wool
- 6.8. Organomation 24-Station N-Evaporator
- 6.9. Precleaned Glass fiber thimbles - coarse
- 6.10. Rotary evaporator
- 6.11. Round bottom flasks: 50, 100, 250, and 500 mL
- 6.12. Separatory funnels, typically 250 mL to 2-L size
- 6.13. Soxhlet/Dean-Stark (SDS) Extractor
- 6.14. Teflon boiling chips
- 6.15. Test tubes plus Teflon lined caps, 16 mm x 125 mm

- 6.16. Vials, Glass conical,
- 6.17. Volatile Organic Analysis (VOA) vials, 40 mL
- 6.18. Wiretrol II Precision Disposable Micropipettes
- 6.19. Zymark TurboVap II plus 250 mL tubes with 1 mL stems or equivalent
- 6.20. Equipment CTC Autosampler Model A200S.

7. REAGENTS, SOLVENTS AND STANDARDS

- 7.1. Reagents (Highest purity available)
 - 7.1.1. Acid Silica Gel, 44%
 - 7.1.2. Activated Silica Gel, kilned for ~5 hours at 550°C, granular
 - 7.1.3. Anhydrous sodium sulfate (Na_2SO_4), kilned for ~5 hours at 550°C, granular
 - 7.1.4. Basic Silica Gel, 33%
 - 7.1.5. Florisil
 - 7.1.6. Acid Alumina
 - 7.1.7. Hydrochloric acid, concentrated
 - 7.1.8. Hydromatrix
 - 7.1.9. Ottawa sand, kilned for ~5 hours at 550°C
 - 7.1.10. Ultra-pure nitrogen gas

- 7.1.11. Water, HPLC grade
- 7.2. Solvents
 - 7.2.1. Tetradecane
 - 7.2.2. Hexane
 - 7.2.3. Methylene chloride (DCM)
 - 7.2.4. Toluene
 - 7.2.5. Acetone
 - 7.2.6. Ethyl Acetate
- 7.3. Standards
 - 7.3.1. All analytical standards are obtained from a certified vendor. See SOP 15 and the current spike sheet for more information.

8. QUALITY CONTROL

- 8.1. Method Blank (MB): Method blank is a matrix preparation that is free of native analyte that has been prepared and analyzed using the same procedures followed for the rest of the analytical batch. The method blank should simulate (as close as possible) the matrix to be extracted.
 - 8.1.1. A method blank is run with every analytical batch or 20 samples (whichever is less).
 - 8.1.2. For the determination of the native Hexachloroxanthene, the levels measured in the method blank must be less than the method quantitation limit or ten times lower than the concentration found in any sample within the analytical batch.
 - 8.1.3. All samples within an analytical batch are re-extracted and analyzed if the method blank associated with that batch does not meet criteria.
- 8.2. Ongoing Precision and Recovery (OPR): An OPR is prepared by adding a known quantity of native standards to an interferant free matrix and used to assess method performance (precision and accuracy).

- 8.2.1. A 10 µL aliquot containing 4ng HCX is used for spiking.
- 8.2.2. The control limits are 50-150% for HCX.
- 8.2.3. If the OPR of an isomer is outside the recommended control than the sample and the OPR will be re-extracted and analyzed.
- 8.3. Matrix Spike (MS/MSD): Upon client request, a matrix spike sample is prepared by adding a known quantity of native standards to a sample matrix prior to extraction.
 - 8.3.1. An MS/MSD is performed upon client request.
 - 8.3.2. A 10 µL aliquot containing 4ng HCX is used for spiking.
 - 8.3.3. The relative percent difference between MS/MSD samples should be 20%. If the criteria are not met, the data must be evaluated to determine whether the samples shall be re-extracted or the data are qualified appropriately.
- 8.4. Duplicate Samples: Duplicate samples are two separate aliquots taken from the same source. Duplicate samples are performed upon client request.
 - 8.4.1. A duplicate sample is performed upon client request.
 - 8.4.2. Duplicate samples are analyzed independently to assess laboratory precision.
 - 8.4.3. If the relative percent difference from duplicate sample analyses is greater than 25%, then both duplicate samples will be qualified.

9. COLLECTION, PRESERVATION, AND HANDLING

- 9.1. Extract aqueous samples and sediment samples within 14 days of collection. Analyze within 40 days from extraction
- 9.2. Store all samples at 4°C in the dark
- 9.3. If residual chlorine is detected in an aqueous sample, add 80 mg sodium thiosulfate per liter.

10. SAMPLE PREPARATION

- 10.1. Residual Chlorine Determination (aqueous only)

- 10.1.1. Obtain an Aquacheck strip and place it directly into a small amount of sample in a disposable weigh boat. Move the strip back and forth for 30 seconds.
- 10.1.2. Check the color on the strip against the color chart on Aquacheck container.
- 10.1.3. If there is chlorine present, add 80 mg of sodium thiosulfate.
- 10.1.4. Record procedure on extraction benchsheet.
- 10.2. pH Determination (aqueous only)
 - 10.2.1. Obtain a pH strip and place it directly into a small amount of sample in a disposable weigh boat. Move the strip back and forth for 30 seconds.
 - 10.2.2. Check the color on the strip against the color chart on the pH container. Record the pH.
- 10.3. % Solids Determination
 - 10.3.1. "ZERO" or "TARE" the balance.
 - 10.3.2. Place a weigh boat on the balance and record the weight as "Boat Weight".
 - 10.3.3. Samples are individually homogenized with a clean spoon, spoonula or spatula. Add a portion of the sample (2 – 10 g) to the weigh boat and record the weight as "Wet Wt. + Boat Wt."
 - 10.3.4. Place the weigh boat plus sample in an oven at 110±5°C for at least overnight.
 - 10.3.5. Remove the weigh boat plus sample from the oven and allow to come to room temperature.
 - 10.3.6. "ZERO" or "TARE" the balance.
 - 10.3.7. Place the weigh boat plus sample on the balance and record the weight as "Residue + Boat Wt."
 - 10.3.8. Calculate the percent solids by the following formula:

$$\% \text{Solids} = \frac{(\text{Residue Wt.} + \text{Boat Wt.}) - (\text{Boat Wt.})}{(\text{Wet Wt.} + \text{Boat Wt.}) - (\text{Boat Wt.})} \times 100$$

10.4. Compositing – by client request

- 10.4.1. Samples are individually homogenized, if necessary, with a clean spoon, spoonula or spatula. Aqueous samples should be mixed and shaken to obtain a representative sample.
- 10.4.2. Weigh out approximately 50 grams, or amount designated by the client, from each individual sample and place into a pan.
- 10.4.3. Repeat the homogenization for each sample.
- 10.4.4. Place each individual sample into a new, separate container. Record the weight of each sample on the benchsheet.
- 10.4.5. Retain the original sample containers. The new container is given a new sample ID number and then processed through the appropriate extraction.

10.5. Sample Weight Determination (Aqueous)

- 10.5.1. Volumetric: Allow sample to come to ambient temperature, mark the water meniscus on the side of the 1 L sample bottle. Once the sample has been transferred, fill the sample bottle to the mark with water and transfer to a 1000 mL graduated cylinder. Record the sample volume to the nearest 5 mL.
- 10.5.2. Gravimetric: Sample bottle including sample is placed on calibrated balance. The weight is recorded. The empty bottle is allowed to air-dry overnight and then re-weighed on a calibrated balance. This weight is recorded.

11. EXTRACTION PROCEDURES

11.1. Aqueous Samples

- 11.1.1. Record the combined weight of the bottle, cap and sample for each sample to be extracted. After the sample has been removed from the bottle, allow it to drain overnight and reweigh it and the cap to determine the amount of sample extracted.
- 11.1.2. For the method blank (MB) and OPR(s), transfer ~1 liter of HPLC water into a one liter bottle for each.

- 11.1.3. Add the appropriate volume of Internal Standard (IS) solution to a test tube containing ~1 mL of acetone. Quantitatively transfer to the samples and QC with small portions of the solvent used.
- 11.1.4. Add the appropriate volume of Native Standard (NS) solution to a test tube containing the IS/solvent and then quantitatively transfer to the aliquot of matrix assigned as an LCS, OPR, MS or MSD. Allow the spiked samples to equilibrate for at least 1 hour before extraction.
- 11.1.5. Pour the sample into a 2-liter separatory funnel. Rinse the sample container with ~60 mL of DCM and add it to the separatory funnel.
- 11.1.6. Stopper each separatory funnel and shake vigorously, with frequent venting, for 2 minutes.
- 11.1.7. Allow the phases to separate (centrifugation or other mechanical means may be used to facilitate separation).
- 11.1.8. Drain the DCM extract through a funnel of Na_2SO_4 into a 500 mL round bottom flask.
- 11.1.9. Extract the aqueous phase with two more ~60 mL portions of DCM (shaking 1 minute each time) and pass the extracts through the same funnel of Na_2SO_4 into a round bottom flask.
- 11.1.10. Pass the final extract through Na_2SO_4 one last time and concentrate the extract to approximately 10 mLs.
- 11.2. Soil Samples: 70:30 Hexane/Ethyl Acetate
 - 11.2.1. Samples are individually homogenized with a clean spoon, spoonula or spatula. Weigh the sample (nominal 10 g dry weight equivalent) directly into an analyte-free thimble, carefully breaking up any large lumps of sample.
 - 11.2.2. Add the appropriate volume of IS and NS solutions directly to the aliquot of matrix.
 - 11.2.3. Assemble the soxhlet/Dean-Stark (SDS) apparatus, and add a fresh charge of 70:30 Hexane/Ethyl Acetate to the receiver and reflux flask. Apply power to the heating mantle to begin refluxing.
 - 11.2.4. Reflux the sample for a total of 16 hours. Cool and disassemble the apparatus.

- 11.2.5. Pass extract through Na_2SO_4 .
- 11.2.6. Add CRS and tetradecane to the extract.
- 11.2.7. Concentrate the extracts using the rotary evaporator. Exchange twice with 50 mLs of hexane. Bring to < 2mL of hexane.

12. CLEANUP PROCEDURES

- 12.1. Silica Gel Column Preparation (aqueous only)
 - 12.1.1. Pack an 11 mm. id. x 160 mm. column as per Figure 1.
 - 12.1.2. Pre-rinse the column with 20 mL of hexane. Discard the rinsate.
 - 12.1.3. Quantitatively transfer the sample extract onto the column using a disposable pipet. Rinse with additional hexane and add to the column and collect the eluate.
 - 12.1.4. Just prior to the exposure of the sodium sulfate layer to air, add 25 mL of hexane. After the hexane has passed, elute with 35 mL of 40% DCM/hexane. Continue collection of the eluate into a 100 mL round bottom flask.
 - 12.1.5. Roto-evaporate the eluate to less than 5 mL. Quantitatively transfer to a conical vial, using a hexane rinse. Concentrate appropriately.
- 12.2. Acid Base Silica Gel/Acid Alumina (ABSG/AA) (soil/sediments)
 - 12.2.1. Prepare the column as depicted in Figure 2.
 - 12.2.2. Rinse the ABSG column with ~60 mL hexane, discard the eluate. Rinse the AA column with ~30 mL of DCM and then ~30 mL hexane.
 - 12.2.3. Position the ABSG column so that it elutes directly onto the Acid Alumina column.
 - 12.2.4. Transfer the extract to the ABSG column with 2-4 small portions of hexane.
 - 12.2.5. When the extract reaches the sodium sulfate, add 150 mL of hexane.
 - 12.2.6. When all of the ABSG eluate has passed through the Acid Alumina column, remove the ABSG column, discard all the

eluates.

- 12.2.7. Elute the Acid Alumina column with ~50 mL of 20% DCM:hexane, collect the eluate.
- 12.2.8. Add 100 µL tetradecane and concentrate to the tetradecane at 50°C (only if proceeding to Florisil).
- 12.3. Florisil (F) (soil/sediments)
 - 12.3.1. Prepare the column as depicted in Figure 3.
 - 12.3.2. After removing the florisil jar from the oven, allow the florisil to cool ~ 10 minutes before weighing out 1 gram.
 - 12.3.3. Rinse the column with ~50 mL of DCM, then ~50 mL of hexane, discard the eluate.
 - 12.3.4. Transfer the extract to the column with 2-4 small portions of hexane, discard the eluate.
 - 12.3.5. Elute the column with ~30 mL of hexane, discard eluate.
 - 12.3.6. Elute the column with ~50 mL of DCM, collect the eluate.
 - 12.3.7. Concentrate the eluate appropriately.

13. ADJUST TO FINAL VOLUME

- 13.1. Using hexane, quantitatively transfer the concentrated eluate to a conical vial that contains the Recovery Standard (RS) and 10 µL of tetradecane.
- 13.2. Using nitrogen blow down, concentrate to the tetradecane.
- 13.3. Rinse the walls of the conical with hexane, concentrate down to the tetradecane.
- 13.4. Using a 10-20 µL Wiretrol, transfer the tetradecane to an insert in a crimp top amber autoinjector vial and then cap.

14. GC/MS ANALYSIS

- 14.1. Analyze samples with selected ion monitoring.
- 14.2. Recovery of each internal standard versus the recovery standard must be between 25 – 150% or have a signal to noise ratio > 2.5:1 for natives and > 10:1 for labeled compounds.

15. CALIBRATION

15.1. Initial Calibration

- 15.1.1. An initial calibration curve is created to demonstrate the linearity of the HRMS system over the calibration range. An initial calibration is repeated whenever a new set of spiking calibration standards are created or whenever the continuing calibration falls outside the acceptance criteria.
- 15.1.2. Each calibration standard contains HCX. Calibration standard solutions are presented in Table 2.
- 15.1.3. One internal standard and one recovery standard are used to improve quantitation.
- 15.1.4. See Table 2 for calibration range.
- 15.1.5. 2 μ L maximum injection of standards are made to create an initial calibration curve whenever the continuing calibration check falls outside the acceptable relative response factor window.
- 15.1.6. An initial calibration curve is accepted if the following criteria are met:
 - 1.) The signal to noise ratio (s/n) exceeds 10:1 for all ions monitored.
 - 2.) The ion abundance ratio measurements are within $\pm 15\%$ of the theoretical ratio.
 - 3.) The %RSD for the mean response factors must be within $\pm 20\%$ for the native standards and within $\pm 35\%$ for internal standards.
- 15.1.7. If the criteria are not achieved, a new initial calibration curve must be prepared and analyzed.

15.2. Continuing Calibration

- 15.2.1. A verification (VER) standard from the initial calibration curve (CS3) is injected at the beginning of an analytical 12-hour sequence. The following criteria must be met:
- 15.2.2. The percent deviation recoveries for the native compound must be 70-130% and 50-150% for labeled compounds.

- 15.2.3. The ion ratios are within the criteria listed in Table 1. If the ratios do not meet the acceptance criteria, then the instrument must be recalibrated and the affected samples are reanalyzed.
- 15.2.4. The signal to noise ratio (s/n) must exceed 10:1 for all ions monitored. If the s/n ratio is not met, then associated extracts are re-analyzed.
- 15.3. Qualitative Determination
 - 15.3.1. To identify a chromatographic peak as a HCX, it must meet the following criteria:
 - 1) The signals for the two exact m/zs being monitored must be present and must maximize within ± 2 seconds of one another.
 - 2) The signal-to-noise ratio (S/N) of each of the two exact m/zs must be $\geq 2.5:1$ for a sample extract.
 - 3) The ion abundance ratios must be within the limits established for the homologous series (Table 1A and 1B).
 - 4) The relative retention time of HCX must be within 1.044-1.086 seconds of ^{13}C -1,2,3,7,8,9-HxCDF.
 - 15.3.2. Quantitative Determination
 - 15.3.3. Quantitate the HCX peaks from the response relative to the appropriate internal standard.
 - 15.3.4. Recovery of each internal standard versus the recovery standard must be 25-150%.
 - 15.3.5. Recoveries below the limits may be accepted if the signal to noise is $>10:1$. If the signal to noise is not $>10:1$, samples must be re-extracted and re-analyzed or the data must be qualified.
 - 15.3.6. If a chromatographic peak saturates the detector, a dilution of the extract must be analyzed.

16. CALCULATIONS

- 16.1. The concentration for HCX is calculated by using the formula:

$$C_X = \frac{(A_X)(Q_{IS})}{(A_{IS})(W)(RRF)}$$

Where:

- C_X = Concentration of unlabeled HCX,
 A_X = Sum of the integrated ion abundances of the quantitation ions for unlabeled HCX
 A_{IS} = Sum of the integrated ion abundances of the quantitation ion for the labeled internal standards,
 Q_{IS} = Quantity, in pg, of the internal standard added to the sample before extraction,
 W = Weight of the sample (solid, dry weight or liquid)
 DW = Sample wt. × %solids/100
 RRF = Calculated relative response factor for the analyte.

16.2. The detection limits can be calculated using the following formula:

$$DL = \frac{(2.5)(H_N)(Q_{IS})}{(H_{IS})(W)(RRF)}$$

Where:

- DL = Sample specific estimated detection limit,
 H_N = Noise height (peak to peak),
 H_{IS} = Peak height of the internal standard,
 Q_{IS} = Quantity, in pg, of the internal standard added to the sample before extraction,
 W = Weight of the sample (solid or liquid), and
 RRF = Calculated relative response factor for the analyte.

16.3. The reporting limits can be calculated using the following formula:

$$RL = \frac{(\text{Extract Conc. of Low point of curve})(\text{Final volume})}{(\text{Weight of sample})} (\text{Split})$$

16.4. The Relative Response factor can be calculated using the following formula:

$$RRF = \frac{A_N^1 + A_N^2 (C_{IS})}{A_{IS}^1 + A_{IS}^2 (C_N)}$$

Where:

$A1_N, A2_N$ = Areas of the primary and secondary m/zs for the native compound
 $A1_{IS}, A2_{IS}$ = Areas of the primary and secondary m/zs for the labeled compound.
 C_{IS} = Concentration of the labeled compound in the calibration standard.
 C_N = Concentration of the native compound in the calibration standard

17. POLLUTION PREVENTION

- 17.1. The techniques used in this method are amenable to solvent recovery, and it is recommended that the laboratory recover solvents wherever feasible.
- 17.2. Standards should be prepared in volumes consistent with laboratory use to minimize disposal of standards.

18. WASTE MANAGEMENT

- 18.1. Waste generated in the procedure must be segregated and disposed according to the facility hazardous waste procedures. Safety officer should be contacted if additional information is required.
- 18.2. The laboratory waste management is in compliance with all federal, state, and local regulations to protect the air, water, and land by minimizing and controlling all releases from fume hoods and bench operations.

Glossary

Calibration Standard (CAL) — A solution prepared from a secondary standard and/or stock solutions and used to calibrate the response of the instrument with respect to analyte concentration.

Calibration Verification Standard (VER) — The mid-point calibration standard (CS3) that is used in to verify calibration. See Table 2.

CS0, CS1, CS2, CS3, CS4, CS5, CS6 — See Calibration standards and Table 2.

Field Blank — An aliquot of reagent water or other reference matrix that is placed in a sample container in the laboratory or the field, and treated as a sample in all respects, including exposure to sampling site conditions, storage, preservation, and all analytical procedures. The purpose of the field blank is to determine if the field or sample transporting procedures and environments have contaminated the sample.

GC — Gas chromatograph or gas chromatography.

HCX — Hexachloroxanthene

HRGC — High resolution GC.

HRMS — High resolution MS.

IPR — Initial precision and recovery; four aliquots of the diluted PAR standard analyzed to establish the ability to generate acceptable precision and accuracy. An IPR is performed prior to the first time this method is used and any time the method or instrumentation is modified.

Laboratory Blank — See method blank.

Laboratory Control sample (LCS) — See ongoing precision and recovery standard (OPR).

Laboratory Reagent Blank — See method blank.

May — This action, activity, or procedural step is neither required nor prohibited.

May Not — This action, activity, or procedural step is prohibited.

Method Blank — An aliquot of reagent water that is treated exactly as a sample including exposure to all glassware, equipment, solvents, reagents, internal standards, and surrogates that are used with samples. The method blank is used to determine if analytes or interferences are present in the laboratory environment, the reagents, or the apparatus.

Minimum Level (ML) — The level at which the entire analytical system must give a recognizable signal and acceptable calibration point for the analyte. It is equivalent to

the concentration of the lowest calibration standard, assuming that all method-specified sample weights, volumes, and cleanup procedures have been employed.

MS — Mass spectrometer or mass spectrometry.

Must — This action, activity, or procedural step is required.

OPR — Ongoing precision and recovery sample (OPR); a laboratory blank spiked with known quantities of analytes. The OPR is analyzed exactly like a sample. Its purpose is to assure that the results produced by the laboratory remain within the limits specified in this method for precision and recovery.

PFK — Perfluorokerosene; the mixture of compounds used to calibrate the exact m/z scale in the HRMS.

Preparation Blank — See method blank.

Primary Dilution Standard — A solution containing the specified analytes that is purchased or prepared from stock solutions and diluted as needed to prepare calibration solutions and other solutions.

Quality Control Check Sample (QCS) — A sample containing all or a subset of the analytes at known concentrations. The QCS is obtained from a source external to the laboratory or is prepared from a source of standards different from the source of calibration standards. It is used to check laboratory performance with test materials prepared external to the normal preparation process.

Reagent Water — Water demonstrated to be free from the analytes of interest and potentially interfering substances at the method detection limit for the analyte.

Relative Standard Deviation (RSD) — The standard deviation times 100 divided by the mean. Also termed "coefficient of variation."

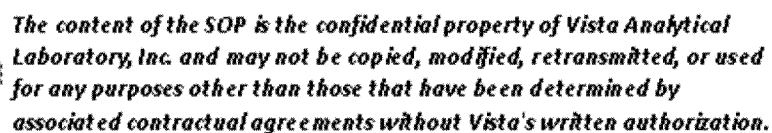

RSD — See relative standard deviation.

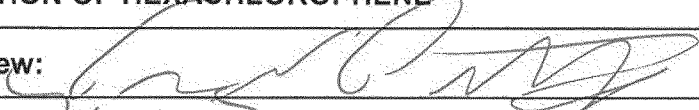

Should — This action, activity, or procedural step is suggested but not required.

SICP — Selected ion current profile; the line described by the signal at an exact m/z.

Stock Solution — A solution containing an analyte that is prepared using a reference material traceable to EPA, the National Institute of Science and Technology (NIST), or a source that will attest to the purity and authenticity of the reference material.

VER — See calibration verification standard.

SOP 50	Revision: 2	Supersedes: Rev 1
PREPARATION AND ANALYSIS OF AQUEOUS AND SOLID MATRICES FOR THE DETERMINATION OF HEXACHLOROPHENE		
Analyst Review: 		
Management: 		
Quality Assurance: 		
Effective Date: 25 November 2013		

[illegible]

1. PURPOSE

- 1.1 This SOP outlines and describes the preparative and analytical techniques used for the determination of hexachlorophene in aqueous and solid matrices.

2. SCOPE

- 2.1 Data determined to be out-of-control from criteria stated within this SOP are handled according to procedures addressed within the applicable section.

Compound	CAS Registry No.*
Hexachlorophene	70-30-4

*Chemical Abstract Service

3. SUMMARY OF METHOD

- 3.1 This procedure utilizes an exhaustive soxhlet/Dean Stark extraction followed by an anion exchange SPE concentration and purification. Detection and quantitation of hexachlorophene is via ultra performance liquid chromatography/tandem mass spectrometry (UPLC/MS/MS) using isotope dilution techniques and internal standard calibration.

4. CONTAMINATION AND INTERFERENCES

- 4.1 Solvents, reagents, glassware and other sample processing hardware may yield discrete artifacts or elevated baselines that may cause misinterpretation of the chromatographic data. All of these materials must be demonstrated to be free from interfering substances under the conditions of analysis by performing laboratory method blanks. The use of high purity reagents and solvents helps to minimize interference problems.
- 4.2 Interferants co-extracted from the sample will vary considerably from matrix to matrix.

5. DEFINITIONS

- 5.1 Definitions are presented in the Glossary.

6. SAFETY

- 6.1 Procedures shall be carried out in a manner that protects the health and safety of all Vista employees.

- 6.2 Each chemical compound should be treated as a potential health hazard. Exposure to these compounds should be reduced to the lowest possible level. All compounds or reagents should be handled only by highly trained personnel thoroughly familiar with handling and cautionary procedures and the associated risks
- 6.3 Additional health and safety information can be obtained from material safety data sheets (MSDSs) available to all personnel involved in these analyses.
- 6.4 In the event of a known or potential compromise to the health and safety of a Vista associate, all work must stop and the incident reported immediately to management.
- 6.5 Contamination of the laboratory will be minimized by conducting most of the manipulations in a hood
- 6.6 The toxicity or carcinogenicity of each chemical used in this method has not been precisely determined; however, each compound should be treated as a potential health hazard. Exposure to these compounds should be reduced to the lowest possible level. The laboratory is responsible for maintaining a current awareness file of OSHA regulations regarding the safe handling of the chemicals specified in this method. A reference file of MSDS should also be made available to all personnel involved in these analyses.

7. APPARATUS AND MATERIALS

Note: All materials used should be suitable for LC work, and comparable brand materials can be substituted where specific brands are mentioned.

- 7.1 Analytical Balances, capable of reading to 0.01g and 0.0001g
- 7.2 Electrothermal electromantle six sample and 500 & 1000 mL capacity
- 7.3 Precleaned Glass fiber thimbles - coarse
- 7.4 Syringe filter, 0.2 μ m
- 7.5 Round bottom flasks: 500mL
- 7.6 Soxhlet/Dean-Stark (SDS) Extractor
- 7.7 Teflon boiling chips
- 7.8 Solid Phase Extraction Manifold (Waters)
- 7.9 Strata - XA (Phenomenex)

- 7.10 Silicone tubing, 1/16" diameter, various lengths (Nalgene)
- 7.11 Screw top polypropylene LC vials, 12x32mm (Waters)
- 7.12 HDPE Bottle various sizes (Nalgene)
- 7.13 Screw caps with pre-slit polypropylene septa, for 12x32mm vials (Waters)
- 7.14 Disposable polypropylene Pasteur pipets, various sizes
- 7.15 Aquacheck strips and pH strips
- 7.16 Test tubes plus Teflon lined caps, 16 mm x 125 mm
- 7.17 Organomation 24-Station N-Evaporator with water bath capable of heating to 65°C
- 7.18 Polypropylene centrifuge tubes, 13 mm x 100 mm
- 7.19 Wiretrol II Precision Disposable Micropipettes
- 7.20 Acquity Ultra Performance LC (Waters)
- 7.21 Lenovo computer work station with MassLynx Software
- 7.22 Quattro Premier XE with Micromass Technology (Waters)

8. REAGENTS, SOLVENTS AND STANDARDS

- 8.1 Reagents (HPLC grade or above)
 - 8.1.1 Dipotassium Phosphate, HPLC grade
 - 8.1.2 Formic Acid, Concentrate
 - 8.1.3 Ultra-pure nitrogen gas
 - 8.1.4 Ultra-pure argon gas
- 8.2 Solvents (HPLC Grade or above)
 - 8.2.1 Reagent Water
 - 8.2.2 Acetonitrile
 - 8.2.3 Hexane
 - 8.2.4 Methanol (MeOH)

8.2.5 Ethanol

8.2.6 Toluene

8.3 Standards

8.3.1 All analytical standards are obtained from a certified vendor.

8.3.2 See SOP 15 and the current spike sheet for more information.

9. COLLECTION, PRESERVATION, AND HANDLING

9.1 HDPE bottles and jars must be used for collection.

9.2 All samples must be extracted within 365 days from collection and analyzed within 365 days of extraction.

9.3 Store at $< 6^{\circ}\text{C}$ in the dark.

10. QUALITY CONTROL

10.1 Each time a modification is made to this method and the detection limit will be affected by the change, the laboratory is required to perform an MDL study.

10.2 Method Blank (MB): Method blank is a matrix preparation that is free of native analyte that has been prepared and analyzed using the same procedures followed for the rest of the analytical batch. Simulate as close as possible the matrix to be extracted.

10.2.1 A MB is analyzed with every analytical batch, or every 20 samples, whichever is less.

10.2.2 For the determination of native Hexachlorophene, the levels measured in the method blank must be below 1/3 the RL or less than 0.1 times the concentration found in the sample. If there is evidence of contamination within the MB, then the source of the contamination must be located. The data must be evaluated to determine whether the batch shall be re-extracted or the data is qualified appropriately.

10.3 Ongoing Precision and Recovery Samples (OPR): An ongoing precision and recovery sample is prepared by adding a known quantity of native standard to an interferant free matrix and used to assess method performance (precision and recovery).

- 10.3.1 Add the appropriate amount of native spike.
- 10.3.2 An OPR is analyzed with every analytical batch, or every 20 samples, whichever is less.
- 10.3.3 The control limits are 50-120% for Hexachlorophene.
- 10.3.4 If the percent recovery of the native or internal standard of an isomer in the OPR and the associated sample(s) are out of method limits, it is recommended that the sample(s) be re-extracted and/or re-analyzed.
- 10.4 Matrix Spike (MS/MSD): A matrix spike sample is prepared by adding the appropriate quantity of native standards to a sample matrix prior to extraction. MS/MSD's are performed if the required amount of sample is provided by the client.
 - 10.4.1 An MS/MSD is performed upon client request.
 - 10.4.2 The percent recovery limits are 50-150% and the relative percent difference between MS/MSD samples should be $\leq 50\%$.
 - 10.4.3 If RPD does not meet the acceptance criteria, the data is evaluated and qualified appropriately.
- 10.5 Duplicate Samples: Duplicate samples are two separate aliquots taken from the same source. Duplicate samples are analyzed independently to assess laboratory precision.
 - 10.5.1 Duplicate Samples are performed upon client request.
 - 10.5.2 The relative percent difference between duplicate samples should be $\leq 50\%$
 - 10.5.3 If the concentration is within a factor of 2 of the MRL, the relative percentage difference (RPD) must be $\leq 50\%$
 - 10.5.4 If the RPD does not meet the acceptance criteria, the data are evaluated and qualified appropriately.
- 10.6 Second source standard: Analytes from a different source than that of the calibration standards. This is prepared and analyzed in the same way as a CS3.
 - 10.6.1 This is analyzed every time new standards are prepared.
 - 10.6.2 The calculated value for the second source standard must be within $\pm 30\%$ of the expected value.

11. SAMPLE PREPARATION

- 11.1 Residual Chlorine Determination (aqueous only)
 - 11.1.1 Obtain an Aquacheck strip and place it directly into a small amount of sample in a disposable weigh boat. Move the strip back and forth for 30 seconds.
 - 11.1.2 Check the color on the strip against the color chart on Aquacheck container.
 - 11.1.3 If there is chlorine present add Trizma to the sample bottle.
 - 11.1.4 Record the procedure on extraction bench sheet.
- 11.2 pH Determination (aqueous only)
 - 11.2.1 Obtain a pH strip and place it directly into a small amount of sample in a disposable weigh boat. Move the strip back and forth for 30 seconds.
 - 11.2.2 Check the color on the strip against the color chart on the pH container. Record the pH.
- 11.3 % Solids Determination
 - 11.3.1 "ZERO" or "TARE" the balance.
 - 11.3.2 Place a weigh boat on the balance and record the weight as "Boat Weight".
 - 11.3.3 Samples are individually homogenized with a clean spoon, spoonula or spatula. Add a portion of the sample (2 – 10 g) to the weigh boat and record the weight as "Wet Wt. + Boat Wt."
 - 11.3.4 Place the weigh boat plus sample in an oven at $110\pm 5^{\circ}\text{C}$ for at least overnight.
 - 11.3.5 Remove the weigh boat plus sample from the oven and allow to come to room temperature.
 - 11.3.6 "ZERO" or "TARE" the balance.
 - 11.3.7 Place the weigh boat plus sample on the balance and record the weight as "Residue + Boat Wt."
 - 11.3.8 Calculate the percent solids by the following formula:

$$\% \text{Solids} = \frac{(\text{Residue Wt.} + \text{Boat Wt.}) - (\text{Boat Wt.})}{(\text{Wet Wt.} + \text{Boat Wt.}) - (\text{Boat Wt.})} \times 100$$

11.4 Compositing – by client request

- 11.4.1 Samples are individually homogenized, if necessary, with a clean spoon, spoonula or spatula. Aqueous samples should be mixed and shaken to obtain a representative sample.
- 11.4.2 Weigh out approximately 50 grams, or amount designated by the client, from each individual sample and place into a pan.
- 11.4.3 Repeat the homogenization for each sample.
- 11.4.4 Place each individual sample into a new, separate container. Record the weight of each sample on the benchsheet.
- 11.4.5 Retain the original sample containers. The new container is given a new sample ID number and then processed through the appropriate extraction.

12. EXTRACTION PROCEDURES

12.1 Aqueous Samples

- 12.1.1 The appropriate aliquot of the sample will be taken gravimetrically.
- 12.1.2 For the method blank (MB) and OPR(s), transfer ~250 mL of HPLC water into a bottle for each.
 - 12.1.2.1.1 Add the appropriate volume of Internal Standard (IS) solution and the appropriate volume of Native Standard (NS) solution to OPR, MS or MSD. Allow the spiked samples to equilibrate for at least 1 hour before extraction.

12.2 Soil Samples

- 12.2.1 Samples are individually homogenized with a clean spoon, spoonula or spatula. Weigh the sample (nominal 10 g dry weight equivalent) directly into an analyte-free thimble, carefully breaking up any large lumps of sample.

- 12.2.2 Add the appropriate volume of IS and NS solutions directly to the aliquot of matrix.
- 12.2.3 Assemble the soxhlet/Dean-Stark (SDS) apparatus, and add a fresh charge of solvent to the receiver and reflux flask. Apply power to the heating mantle to begin refluxing.
- 12.2.4 Reflux the sample for a total of 16 hours. Cool and disassemble the apparatus.
- 12.2.5 Concentrate the extracts using the rotary evaporator. Exchange twice with 50 mL of hexane. Bring to < 2mL of hexane.
- 12.2.6 Bring up volume to ~10mLs with methanol.
- 12.3 Extraction and Cleanup
 - 12.3.1 Assemble the SPE apparatus and attach the SPE strata - XA cartridges as shown in the appendix, Figure 1.
 - 12.3.2 Condition the cartridges by eluting with acetonitrile followed by 100mM dipotassium phosphate. Discard eluant.
 - 12.3.3 Load sample onto cartridge by way of siphon.
 - 12.3.4 Wash the cartridges with 100mM dipotassium phosphate
- 12.4 Cartridge Elution
 - 12.4.1 Elute the cartridge with 5% formic acid in acetonitrile.
 - 12.4.2 Collect extracts eluted from the column into clean test tubes.
- 12.5 Adjustment to Final Volume
 - 12.5.1 Concentrate extract to ~ 200 μ L under a gentle stream of nitrogen and a water bath set at $50 \pm 5^{\circ}\text{C}$
 - 12.5.2 Bring to a volume of ~ 450 μ L with H₂O.
 - 12.5.3 Transfer the concentrated eluate to an auto injector vial that contains the Recovery Standard (RS).

13. LC/MS ANALYSIS

- 13.1 Establish the necessary conditions. The LC conditions may be

optimized for compound separation and sensitivity. Once optimized, the same LC conditions must be used for the analysis of all standards, blanks, OPR aliquots and samples. The following LC operating conditions are guidance and adjustments may be required

Column: Waters BEH C18, 10.0cm, 2.1 mm i.d., 1.7 μ m particle size
Ionization: Negative Ion Electrospray
Acquisition: MRM mode, unit resolution
Injection Volume: 5-15 μ L

General LC Conditions	
Column Temp	50°C
Max Pressure	15,000 psi
Autosampler Tray Temp.	18°C
MS Conditions	
Source Temp.	150°C
Desolvation Temp.	400°C
Cone/Desolvation Gas Rate	25 L/hr/ 850 L/hr

LC Gradient Program			LC Gradient Program	Gradient
Time (min)	Flow Mixture*			
0.00	99%A	1%B	0.300	1
1.00	99%A	1%B	0.300	1
4.50	20%A	80%B	0.300	6
5.60	2%A	98%B	0.300	7
7.10	2%A	98%B	0.300	6
7.20	99%A	1%B	0.300	1
8.60	99%A	1%B	0.300	1

- Solvent A = 0.1% Ammonium acetate/Acetic acid in water
- Solvent B = 1:1 Methanol:Acetonitrile

13.2 Initial Calibration (ICAL)

- 13.2.1 An initial calibration curve is created to demonstrate the linearity of the LCMS system over the calibration range.

An initial calibration is repeated at least annually, whenever a new set of spiking calibration standards is created or whenever the continuing calibration falls outside the acceptance criteria.

- 13.2.2 Establish the operating conditions suggested in Section 14.1
 - 13.2.3 Each calibration standard contains Hexachlorophene. Calibration standard solutions are presented in Table 1A.
 - 13.2.4 One internal standard and one recovery standard are used to improve quantitation.
 - 13.2.5 See Table 1B for calibration range.
 - 13.2.6 The %RSD must be ≤ 20 for the native analyte and ≤ 30 for the internal standard.
- 13.3 Continuing Calibration
- 13.3.1 A verification (VER) standard from the initial calibration curve (CS3) is injected at the beginning of an analytical 12-hour sequence.
 - 13.3.2 The CS3 verification is acceptable if the following criteria are met:
 - 13.3.2.1.1 The LC peak representing each native and labeled compound must be present with a $S/N \geq 10$.
 - 13.3.2.1.2 The percent recovery for both the native and labeled compound must be 70-130%.
 - 13.3.2.1.3 The retention times must be within ± 15 seconds of the respective retention times and a Relative Retention Time (RRT) of ± 0.008 from the most recent CS3.
- 13.4 Qualitative Determination
- 13.4.1 To identify a chromatographic peak as hexachlorophene (either an unlabeled or a labeled compound), it must meet the following criteria
 - 13.4.2 The signals for the parent-daughter m/z s being monitored must be present and the centroid must maximize within ± 2.5 seconds and a RRT of ± 0.008 of one another.

- 13.4.3 The signal to noise ratio (S/N) at the LC peak maximum for each native compound must be greater than or equal to 2.5 for each compound detected in a sample extract
- 13.4.4 The ratio of the integrated areas of the two exact m/zs must be within the $\pm 35\%$ of the abundance ratio calculated from either the most recent ICAL or the CS3 results.
- 13.4.5 The retention time of the peak for a native compound must be within ± 15 seconds of its RT in the most recent CS3.
- 13.5 Quantitative Determination
 - 13.5.1 Recovery of the internal standard versus the recovery standard must be within 5-153%.
 - 13.5.2 Recoveries below the limits may be accepted if the signal to noise is $>10:1$. If the signal to noise is not $>10:1$, samples must be re-extracted and re-analyzed or the data must be qualified.
 - 13.5.3 If a chromatographic peak of any of the analyte saturates the detector, a dilution of the extract must be analyzed.

14. CALCULATIONS

- 14.1 The concentration of each compound is calculated as follows:

$$C_{Samp} = \frac{A_x C_y}{A_y RRF}$$

Where:

- C_{Samp} = Concentration of compound in sample
- A_x = Sum of areas of daughter m/z for native compound in sample
- A_y = Sum of areas of daughter m/z for labeled compound in sample
- C_y = Concentration of Internal Standard in sample
- RRF = Relative response factor, a sum of the response factors (RF):

$$\sum RF = \frac{A_n C_i}{A_i C_n}$$

Where:

- C_i = Internal Standard Concentration at the curve point
- A_x = Area of daughter m/z for native compound
- A_i = Area of daughter m/z for labeled compound
- C_n = Concentration of Native Standard at the curve point

14.2 The detection limits can be calculated using the following formula:

$$DL = \frac{(2.5)(H_N)(Q_{IS})}{(H_{IS})(S)(RRF_N)}$$

Where:

DL = Detection Limit,
H_N = Noise height (peak to peak),
H_{IS} = Peak height of the internal standard,
Q_{IS} = Quantity, in pg, of the internal standard added to the sample before extraction
S = Weight or volume of the sample, and
RRF_N = Calculated relative response factor for the analyte.

14.3 Internal standard recoveries are calculated by using the formula:

$$\%Rec = \frac{(A_{IS}^1 + A_{IS}^2)(C_{RS})}{(A_{RS}^1 + A_{RS}^2)(C_{IS})(RRF_{IS})} \times 100$$

Where:

A_{IS}¹, A_{IS}² = Areas of the primary and secondary m/z's for the internal standard.
A_{RS}¹, A_{RS}² = Areas of the primary and secondary m/z's for the recovery standard.
C_{IS} = Concentration of the internal standard.
C_{RS} = Concentration of the recovery standard.
RRF_{IS} = Calculated relative response factor for the internal std. analyte.

14.4 Relative Response Factors can be calculated using the following formula:

$$RRF = \frac{(A_N^1 + A_N^2)(C_{IS})}{(A_{IS}^1 + A_{IS}^2)(C_N)}$$

Where:

A_N¹, A_N² = Areas of the primary and secondary m/z's for the native compound
A_{IS}¹, A_{IS}² = Areas of the primary and secondary m/z's for the labeled compound.
C_{IS} = Concentration of the internal standard in the calibration standard.
C_N = Concentration of the native compound in the calibration standard

14.5 RRF for unlabeled analytes (RRF_N) and for labeled analytes (RRF_{IS}):

$$RRF_N = \frac{(A_X)(Q_{IS})}{(Q_X)(A_{IS})} \quad RRF_{IS} = \frac{(A_{IS})(Q_{RS})}{(Q_{IS})(A_{RS})}$$

Where:

A_X = Sum of the integrated ion abundances of the quantitation ions for the unlabeled analyte

- A_{IS} = Sum of the integrated ion abundances of the quantitation ions for the labeled standards
 A_{RS} = Sum of the integrated ion abundances of the quantitation ions for the labeled recovery standards
 Q_{IS} = Quantity of internal standard injected (pg)
 Q_{RS} = Quantity of recovery standard injected (pg)
 Q_X = Quantity of unlabeled analyte injected (pg)

14.6 The RPD is calculated as follows:

$$RPD = \frac{(H - L)}{(H + L)/2} * 100$$

Where:

- RPD = Relative Percentage Difference
 H = Highest area
 L = Lowest area

14.7 The peak asymmetry factor is calculated as follows:

$$A_s = \frac{b}{a}$$

Where:

- A_s = Peak symmetry factor
 b = Width of the back half of the peak measured (at 10% peak height) from the trailing edge of the peak to a line dropped perpendicularly from the peak apex.
 a = Width of the front half of the peak measured (at 10% peak height) from the leading edge of the peak to a line dropped perpendicularly from the peak apex.

15. POLLUTION PREVENTION

- 15.1 The solvent evaporation techniques used in this method are amenable to solvent recovery, and the laboratory shall recover solvents wherever feasible.
- 15.2 Standards should be prepared in volumes consistent with laboratory use to minimize disposal of standard.

16. WASTE MANAGEMENT

- 16.1 Waste generated in the procedure must be segregated and disposed according to the facility hazardous waste procedures. Safety officer should be contacted if additional information is required.
- 16.2 The laboratory waste management is in compliance with all federal, state, and local regulations to protect the air, water, and land by minimizing and controlling all releases from fume hoods and bench operations

Glossary

Analyte — A pharmaceutical or personal-care product tested for by this method. The analytes are listed in Table 1.

Calibration Standard — A solution prepared from a stock solution and used to calibrate the response of the HPLC/MSMS.

Calibration Verification Standard (CCC) — The mid-point calibration standard (CS3) that is used in to verify calibration. See Table 3.

Field Reagent Blank — A field reagent blank is a matrix preparation that is free of native analyte transported to the field in sealed containers and returned with the samples

Internal Standard — A labeled compound used as a reference for quantitation of other labeled and native compounds.

IPR — Initial precision and recovery; four aliquots of a reference material spiked with analytes of interest are analyzed to establish the ability of the laboratory to generate acceptable precision and recovery. An IPR is performed anytime the method or instrumentation is modified.

Isotope dilution quantitation — Determination of a naturally occurring (native) compound by reference to the same compound in which one or more atoms has been isotopically enriched. This method employs ^2H or ^{13}C labeled analogs which are spiked into each sample

LC — Liquid chromatography

Labeled Compound — A molecule in which one or more of the atoms is isotopically enriched, thereby increasing the mass of the molecule

Laboratory Blank — See method blank.

May — This action, activity, or procedural step is neither required nor prohibited.

May Not — This action, activity, or procedural step is prohibited.

Method Blank — An aliquot of reagent water that is treated exactly as a sample including exposure to all glassware, equipment, solvents, reagents, internal standards, and surrogates that is used with samples. The method blank is used to determine if analytes or interferences are present in the laboratory environment, the reagents, or the apparatus.

Method Detection Limit (MDL) — The lowest concentration at which an analyte can be detected under routine operating conditions (see 40 CFR 136, Appendix B).

MS — Mass spectrometer or mass spectrometry.

Must — This action, activity, or procedural step is required.

Native Compound — A molecule in which all atoms have naturally occurring isotopic abundances

OPR — Ongoing precision and recovery sample (OPR); a laboratory blank spiked with known quantities of analytes. The OPR is analyzed exactly like a sample. Its purpose is to assure that the results produced by the laboratory remain within the limits specified in

this method for precision and recovery.

Reagent Water — Water demonstrated to be free from the analytes of interest and potentially interfering substances at the method detection limit for the analyte.

Relative Standard Deviation (RSD) — The standard deviation times 100 divided by the mean. Also termed "coefficient of variation."

RPD — Relative Percent Difference shown

RF — Response factor.

RRF — Relative response factor.

Should — Although this action, activity, or procedural step is suggested, it is not required.

SICP — Selected ion current profile; the line described by the signal at an exact m/z.

Signal-to-noise ratio (S/N) — The height of the signal as measured from the mean of the noise to the peak maximum divided by the width of the noise.

SPE — Solid-phase extraction; an extraction technique in which an analyte is extracted from an aqueous sample by passage over or through a material capable of reversibly adsorbing the analyte.

Stock Solution — A solution containing an analyte that is prepared using a reference material traceable to EPA, the National Institute of Science and Technology (NIST), or a source that will attest to the purity and authenticity of the reference material.

UPLC — Ultra performance liquid chromatography

SAMPLE ANALYSIS BY GAMMA SPECTROMETRY

1.0 PURPOSE

This method describes the use of gamma spectroscopy for the measurement of gamma photons emitted from radionuclides without separating them from the sample matrix. The method can be applied to soil, water, air filters, etc. providing the sample can be condensed or reduced in size such that it can be placed in a calibrated geometry for counting.

2.0 DETECTION LIMIT

The detection limits for Cs-134 and Cs-137, which are 10 and 20 pCi/L respectively, are met with this procedure. Many other isotopes can be identified with this method and the detection limits are established by the customer or regulatory agency that governs the specific project.

3.0 SCOPE AND APPLICATION

3.1 Two types of gamma detectors are currently used, sodium iodide crystal, NaI, and high purity germanium detector, HPGe. Because of its energy resolution advantage and the availability of large active volume detectors, a HPGe detection system is used for measuring gamma emitting radionuclides.

3.2 The method is applicable for analyzing aqueous, non-aqueous, and solids samples that contain radionuclides emitting gamma photons with energies ranging from about 55 to 2000 keV.

4.0 SUMMARY OF METHOD

Solid samples are mixed as well as possible in their as-received containers. Liquid samples are shaken immediately before being transferred to the counting container. No other sample processing is done except to transfer to a suitable container (or plate) for counting.

A portion of the as-received or dried and ground sample is placed in a container such as a poly-bottle or marinelli beaker for which a calibration exists. An intrinsic germanium detector, interfaced with an 8192-channel multichannel analyzer controlled by Canberra Genie 2000 software is used to acquire and analyze the gamma spectrum. Data is then corrected for background.

5.0 DEFINITIONS

- 5.1 Accuracy – The closeness of agreement between an observed value and an accepted value.
- 5.2 Batch – A group of samples which behave similarly with respect to the sampling or the testing procedures being employed and which are processed as a unit.
- 5.3 Bias – the deviation due to matrix effects of the measured value from a known spiked amount.
- 5.4 Matrix Duplicate – An intralaboratory split sample which is used to document the precision of a method in a given sample matrix.
- 5.5 Matrix – The component or substrate which contains the analyte of interest; ie: surface water, drinking water, or soil.
- 5.6 Method Detection Limit – The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero.
- 5.7 Precision – The agreement among a set of replicate measurements without assumption of knowledge of the true value. Precision is estimated by means of duplicate/replicate analyses.
- 5.8 MAPEP – The United States Department of Energy *Mixed Analyte Performance Evaluation Program*.

6.0 INTERFERENCES

- 6.1 Interferences are minimal in this method due to the high resolution of the intrinsic germanium detector.
- 6.2 Naturally occurring radionuclides found in building components may result in the background peaks not truly in the sample. These are corrected during the data reduction process.

7.0 SAFETY PRECAUTIONS

7.1 Hazardous Chemicals/Equipment

All work is to be performed in a fume hood with the following chemicals, 1) nitric acid, concentrated, and 2) hydrofluoric acid.

7.2 Radiological Hazards

When working with radioactive materials that are capable of being volatilized or airborne, perform activities in a fume hood.

7.3 General Laboratory Safety

Refer to the Laboratory Chemical Hygiene Plan for general laboratory safety.

8.0 EQUIPMENT AND SUPPLIES

8.1 Marinelli beakers: 1.0 and 2.0-L.

8.2 Graduated cylinders: 1.0 and 2.0-L.

8.3 Poly-bottles and poly-containers: 160 & 500 mL.

8.4 Petri dishes: 50mm, 95mm and 100mm plastic disposable

8.5 Spatula.

8.6 Electric or duct tape.

8.7 Analytical balance.

8.8 High purity germanium detector with shield.

8.9 Spectroscopy amplifier.

8.10 High voltage supply.

8.11 Multichannel analyzer: 4096 channels, equipped with Computer with printer and Genie 2000 application software.

8.12 90 mm or 47mm / 0.45 μ m membrane filter

8.13 Filtration System

8.14 Pestle and mortar

8.15 12 and 60 mesh sieve

8.16 Liquid Nitrogen – Nitrogen Service

8.17 ½ inch porcelain ball grinding media, Fisher # 08-400A or equivalent.

8.18 Tumbler – Rotary Extractor – capable of rotating extraction vessels in an end-over-end fashion.

9.0 REAGENTS AND STANDARDS

NOTE: All chemicals used for reagents are ACS or equivalent.

9.1 Deionized Water.

9.2 Sand-method blank

9.3 Calibration Standards – NIST or equivalent

	Source #	Geometry	Wt/Vol
9.3.1	R497-B1	B1 - 160ml bottle	241g
9.3.2	R497-C1	C1 -500ml container	624g
9.3.3	R497-M1	M1 -1L marinelli	1 L
9.3.4	R497-M2	M2 -2L Marinelli	2 L
9.3.5	R497-P1	P1 (50 mm petri dish)	32g
9.3.6	R497-P2	P2 (100 mm petri dish)	147g
9.3.7	R497-P3	P3 (100 mm petri dish)	85.6g
9.3.8	I129-3622-SS	M500 -500 mL marinelli	500 ml (I129)

10.0 SAMPLE COLLECTION AND PRESERVATION

10.1 Samples should be collected and stored in plastic rather than glass to prevent loss due to breakage during transportation and handling.

10.2 Samples should be preserved at the time of collection with nitric acid to the pH of 2 or less. If samples are to be collected without preservation, they should be brought to the laboratory within 5 days and then preserved and held in the original container for a minimum of 16 hours before analysis or transfer of the sample. Samples do not require refrigeration.

Note: If soluble or insoluble analysis is requested do not preserve.

10.3 Care should be taken during shipment of samples to avoid a contaminating spillage or cross contamination of multiple samples.

11.0 QUALITY CONTROL

11.1 Sample Quality Control

11.1.1 Prepare a lab control standard and a duplicate for each batch of up to twenty like samples. A method blank is to be counted if requested by client.

11.1.2 Blanks are prepared using sand for solid matrices and reagent water for aqueous matrices.

11.2 Instrument Quality Control

11.2.1 Count a background check for 1800 seconds or longer on each detector each day it is in use or with each sample batch.

11.2.2 Count a 60,000 second blank monthly, at a minimum, for each matrix analyzed to be used for background correction.

11.2.3 Count the appropriate check source for sample geometry for a minimum of 300 seconds on each detector each day the detector is in use. The B1 source check is used to monitor detector stability.

11.2.4 Upload data into QA file to evaluate source check. Print out and place in data gamma spec. run file.

B1 - 59, 662, 1173, and 1332

C1 - 59 or 88, 662, 1173, and 1332

P1-P3 - 59 or 88, 662, 1173, and 1332

M1-M2 - 59 or 88, 662, 1173, and 1332

ALL ENERGY LINES SELECTED FOR DETECTOR MUST PASS

11.3 Corrective Action

11.3.1 Nonconformances may occur at any level. Some may be corrected immediately and documented using normal laboratory document procedures. Out-of-control nonconformances shall be documented by the use of a Corrective Action Report. With the use of a CAR, findings can be tracked and used to detect future trends.

11.3.2 Work shall be stopped when out-of-control deficiencies occur until the problem is alleviated, ie., instrumentation malfunction, QC out of control limits, failure to perform demonstration of capabilities, etc.

12.0 CALIBRATION

Note: Calibration is performed on each spectrometer system at least annually, at a minimum, on each geometry in which measurements will be made.

- 12.1 Determine which calibration standard needs to be used and place in appropriate detector.
- 12.2 Acquire spectrum following steps 13.3.
- 12.3 Save Calibration with the following format:

XXZZMMDD.MCA

where XX = the detector number
ZZ = a geometry description (e.g., MI is a 1 L marinelli beaker).
MM = Month
DD = Day

- 12.4 Select from the **Calibration** Menu.
- 12.5 Select **Full Energy Calibration** from the Calibration Menu and select appropriate geometry. (KeV \approx 0.5 per channel, Full width half max, FWHM, < 3.0 for Co-60 at 1173 KeV).
- 12.6 Select **Full Efficiency** from the Calibration Menu and select appropriate geometry.
- 12.7 Save the sample data using the following format:

ZZMMDDYY.CAL

where ZZ = a geometry description (e.g., M1 is a 1 L marinelli beaker).
MM = Month
DD = Day
YY = Year

- 12.8 Repeat for each detector and calibration source.

13.0 PROCEDURE

Note: If a detector has been out of service (e.g., thermocycle), do not apply bias across the detector unless it has been sufficiently cooled to liquid nitrogen temperatures overnight.

13.1 Water Sample Preparation

- 13.1.1 Measure 0.1, 0.5, 1.0 or 2.0 L of a sample and transfer into the appropriate sized marinelli beaker. Aliquot depends on sample available, but 1.0 or 2.0 L is

preferable. If less than 1 liter sample needs to be diluted to 1 liter with deionized water. Record volumes in the Sample Process Log.

Note: If soluble and insoluble are requested filter the sample through a 90 or 47 mm/0.45 μ m pore size filter. Transfer filtrate to an appropriate sized marinelli beaker and save filter for analysis. Place filter in labeled Ziploc bag.

13.1.2 Place a lid on the container and seal it with tape. Apply label supplied from Sample Receiving showing the new Sub-ID.

13.1.3 Transfer the container to the counting room for analysis.

13.2 Soil or Sludge Sample Preparation

Note: If sample does not require drying and grinding, skip to step 13.2.9.

SOP WET_24 provides more detail regarding solid prep procedures.

13.2.1 Weigh sample before putting in oven. Record in Sample Process Log.

13.2.2 Dry sample at 100°C for at least 16 hours. If Beryllium-7 is requested, sample must be dried at no more than 70°C due to its volatility.

13.2.3 Weigh sample again after taking out of oven. Record in Sample Process Log.

13.2.4 Grind the sample in an exhaust hood and pass through a 12 or 60 mesh sieve.

13.2.5 Place well mixed sample into appropriate container. Fill the container full with sample depending on the volume of sample available and cap the bottle or container and seal with tape.

If there is not enough sample to fill a 160ml bottle, a petri dish (P1-P3) may be used. Solid samples should be compacted as well as possible to eliminate channels and air pockets.

13.2.6 Weigh the filled sample bottle subtracting the bottles tare weight.

13.2.7 Record all actions in the Sample Process Log.

13.2.8 Apply label supplied from Sample Receiving to sample.

13.2.9 Place sample in a plastic bag prior to counting to prevent contamination on the detector.

13.2.10 Transfer the sample to the counting room for analysis.

13.3 Data Acquisition

13.3.1 Record the detector number, sample identification number, volume, count date and geometry in the gamma spec log book.

13.3.2 Place the samples in the appropriate detector cavities and close the shield lids.

13.3.3 Preset the appropriate counting time using the **MCA-Aquire setup** keys. Liquid samples are typically counted for 500 minutes (30,000 sec) and solid samples are typically counted for 100 minutes (6000 sec). Counting times may be lengthened or shortened depending on required minimum detectable activities (MDA).

13.3.4 Clear any previous spectra on the screen by selecting the clear button on the screen. (Be sure previous spectra have been stored prior to erasing.)

13.3.5 Acquire the sample spectra by selecting the **Start** button on the screen. Select **Edit** from the top menu and enter sample information. Enter data in the appropriate fields.

13.3.6 Save the acquired spectra individually. This is accomplished by selecting **File** then **Save**. Save the sample using the following format:

The filename has the following format:

 XXZZZZSS.CNF
where XX = the detector number. ie., Detector 1 – 01
 ZZZZ = the unique batch number assigned to the samples.
 SS=sample sub id

13.3.7 Detectors may be operated independently by following steps 13.3.1 through 13.3.5.

13.4 Spectral Data Reduction

13.4.1 Select **Analyze** from the top menu.

13.4.2 Select from the Macro for detector analysis being performed on.

13.4.3 Select from File Menu-**Print Listing**.

13.4.4 Save the sample data using the following format:

The filename has the following format:

where XXZZZZSS.CNF
 XX = the detector number. ie., Detector 1 – 01
 ZZZZ = the unique batch number assigned to the samples.
 SS=sample sub id

13.5 Data Collection

Document the data in a bound lab notebook for each set of analyses performed. Entries must be made at the time of analysis and include the following:

- description of activity being documented (e.g., “gamma Spec Analysis”) and procedure being followed.
- Date analysis started and analyst(s) initial(s).
- count length.
- Outreach batch number, sample ID, count time and sample aliquot. Identify any lab quality control samples (LCSs).

13.6 Data Reduction and Reporting for Gamma Spec

Using the Canberra Genie 2000, report gamma spectroscopy scan data as follows:

Report each nuclide that the data system has identified and quantified to two significant figures along with the counting uncertainty rounded to two significant figures with the following provisos:

- Report only those nuclides positively identified and quantified by the Canberra program.

In evaluating the identification made by the software, consider the following:

- Agreement of results for multiple photon peaks of a given nuclide.
- Possible identifications of any unidentified peaks.
- Possibility that identified nuclides may actually be low abundance peaks of other nuclides found in the sample that have not been included in the libraries.

Document and support changes to automated nuclide identifications on the instrument printout.

- Do not report a lower order of magnitude (decimal place) in the uncertainty than will be reported in the activity.

Examples:

176 +/- 32.1 pCi/L is reported as 176 +/- 32

176 +/- 8.7 pCi/L is reported as 176 +/- 9

- If the counting uncertainty is greater than the reported activity, do not report the nuclide as found. (Unless requested by customer.)
- If no nuclides are identified by the data system, report "ND" in the results column of the LIMS data entry screen and "ND = Not detected" in the Value Text field of the data entry screen.

13.7 Data Reduction and Reporting for Specific Target Nuclides

If a specific nuclide is listed as an analyte in the LIMS and it was identified and quantified by the data system, report it as described above. If the specific nuclide is not identified and quantified by the data system, report the minimum detectable activity (MDA) for those nuclides as calculated by the data system. Report MDA values to one significant figure.

Qualify results for soil samples as follows: "Samples were oven-dried at 103°C prior to analysis. Nuclides volatile at this temperature are, therefore, excluded from analysis."

14.0 CALCULATIONS

The Genie 2000 software calculates the data using programs provided by Canberra and takes into account many variables. If Outreach calculates manually these are the equations used.

$$\text{ACTIVITY} = \frac{(\text{CPM}_{\text{sample}} - \text{CPM}_{\text{bkgd}})}{R * V * E * D * 2.22}$$

$$\text{ERROR} = \frac{1.96 * \text{SQRT}(\frac{\text{CPM}_{\text{sample}}}{T_{\text{sample}}} + \frac{\text{CPM}_{\text{bkgd}}}{T_{\text{bkgd}}})}{\text{CPM}_{\text{sample}}}$$

$$R * V * E * D * 2.22$$

$$MDR = 4.65 * \text{SQRT}(\text{CPM}_{\text{bkgd}}) + \frac{2.71}{T}$$

$$MDA/MDC = \frac{MDR}{R * V * E * D * 2.22}$$

T	=	Count time
R	=	Chemical or Tracer recovery
V	=	Sample Volume or Weight
E	=	Efficiency
2.22	=	Conversion from dpm to pCi
D	=	Radionuclide decay factor $e^{-\lambda t}$

15.0 METHOD PERFORMANCE

15.1 Method performance is established by the use of demonstration of capability documentation. Performance evaluations by way of *QAP* and/or *MAPEP* are performed to track ongoing competency.

15.2 Method Detection Limits may be established but will vary due to sample matrices as well as concentration of particular isotopes found in the sample(s).

16.0 POLLUTION CONTROL

Refer to the Laboratory Chemical Hygiene Plan, SOP# GEN_22, for laboratory pollution control.

17.0 DATA ACCEPTANCE CRITERIA

Calibration/QC Sample	Frequency	Acceptance Criteria	
Instrument Calibration Standard	Daily	Control chart ± 3 sigma	Recount twice, if not in control limits place detector on hold for maintenance
Instrument Calibration Blank	Daily	Result-error \leq SDL	Recount twice, if not in control limits, place detector on hold for maintenance
Laboratory Control Standard (LCS)	5%	80 – 120% or acceptance range by vender.	Reanalyze LCS and all associated samples
Duplicate	5%	< 20 RPD	If not in control limits, flag and report in case narrative

18.0 EQUIPMENT/INSTRUMENT MAINTENANCE & TROUBLESHOOTING

Maintenance is outlined in SOP GEN 17.

19.0 WASTE MANAGEMENT

Refer to SOP #GEN_19 (Hazardous Material Management) and SOP #GEN_20 (Waste Disposal) for laboratory waste management.
